## ***EMC* EMISSION - TEST REPORT**

JQA APPLICATION No. : KL80040500

Name of Product : CYCLOCOMPUTER

Model/Type No. : CC-MC100W

FCC ID : ON5SPDSENSOR A

Applicant : CATEYE CO., LTD.

Address : 2-8-25, Kuwazu, Higashi-Sumiyoshi-Ku, Osaka, Japan

Manufacturer : CATEYE CO., LTD.

Address : 2-8-25, Kuwazu, Higashi-Sumiyoshi-Ku, Osaka, Japan

Receive date of EUT : December 21, 2004

**Final Judgement** : **Passed**

**TEST RESULTS IN THIS REPORT** are obtained in use of equipment that is traceable to National Institute of Advanced Industrial Science and Technology(AIST) under METI Japan and National Institute of Information and Communications Technology(NICT) under MPHPT Japan.

**THE TEST RESULTS** only responds to the test sample. This test report shall not be reproduced except in full.

## **TEST REGULATION**

FCC Rules and Regulations Part 15 Subpart A and C (Effective October 7, 2004)

- ☐ - Class A Digital Device
- ☐ - Class B Digital Device
- ☒ - Intentional Radiator

### **Test procedure:**

Radiated emission test was performed according to the procedures in ANSI C63.4-2003.

## **GENERAL INFORMATION**

### **Test facility:**

- 1) Test Facility located at Kita-Kansai : 1st Open Site (3 m Site)  
Test Facility located at Kameoka : 1st Open Site (3, 10 and 30 m, on common plane)  
: 2nd Open Site (3 and 10 m, on common plane)

**FCC filing No. : 31040/SIT 1300F2**

- 2) KITA-KANSAI TESTING CENTER is recognized under the National Voluntary Laboratory Accreditation Program for satisfactory compliance established in Title 15, Part 285 Code of Federal Regulations.  
**NVLAP Lab Code: 200191-0**

### **Description of the Equipment Under Test (EUT):**

- 1) Name : CYCLOCOMPUTER
- 2) Model/Type No. : CC-MC100W
- 3) Product Type : Pre-Production (S/N: S000007/012M)
- 4) Category : Intentional Radiator
- 5) EUT Authorization : ☐ - Verification ☒ - Certification ☐ - D.o.C.
- 6) Transmitting Frequency : 19 kHz
- 7) Highest frequency used/generated : 4 MHz
- 8) Upper frequency of Measurement : 1 GHz
- 9) Power Rating : DC 3V (Lithium Battery CR2032x1) (Main Body)  
DC 3V (Lithium Battery CR2032x1) (Speed Sensor)

### **Definitions for symbols used in this test report:**

- ☒ - Black box indicates that the listed condition, standard or equipment is applicable for this Report.
- ☐ - Blank box indicates that the listed condition, standard or equipment is not applicable for this Report.

## TEST CONDITIONS

	Speed Sensor	--		--		

### **Operation - mode of the EUT:**

The Speed Sensor is transmitting the signal of the wheel rotation.  
The Main Body is receiving the signal of the wheel rotation.

### **Test system:**

The EUT consists of one Main Body and one Speed Sensor.  
The Speed Sensor is connected to the wheel speed simulator.

### **Special accessories:**

None

### **The used (generated) frequencies in the EUT:**

Transmitting frequency(Speed Sensor)	:	19kHz
Receiving frequency(Main Body)	:	19kHz
Main Body	:	32kHz
Speed Sensor	:	4MHz

### **EUT Modification**

- - No modifications were conducted by JQA to achieve compliance to applied levels.
- - To achieve compliance to applied levels, the following change(s) were made by JQA during the compliance test.

The modification(s) will be implemented in all production models of this equipment.

## SUMMARY

### GENERAL REMARKS :

The EUT was tested according to the requirements of FCC Rules and Regulations Part 15 Subpart A and C (Effective October 7, 2004) under the test configuration, as shown in page 11.

The conclusion for the test items of which are required by the applied regulation is indicated under the final judgement.

### FINAL JUDGEMENT :

The "as received" sample;

- - fulfill the test requirements of the regulation mentioned on page 3.
- - fulfill the test requirements of the regulation mentioned on page 3, but with certain qualifications.
- - doesn't fulfill the test regulation mentioned on page 3.

Begin of testing : January 11, 2005

End of testing : January 11, 2005

### **Preliminary Test and Test-setup(Drawings)**

#### **Radiated Emission (Magnetic Field) 9 kHz - 30 MHz:**

The preliminary test was performed according to the description of ANSI C63.4-2003 Sec.8.3.1.1 (Exploratory Radiated Emission Measurements) and Sec.6.2.1 (Tabletop Equipment Tests).

The preliminary test was carried out to investigate the frequency of the emission that has the highest amplitude relative to the limits within normal operating modes, cable positions, and a typical system configuration. In order to find out to the maximum emission, the preliminary test and a final test were performed in accordance with the following steps.

Step 1: One operation mode of the test system was setting.

Step 2: In order to investigate the frequencies of maximum emissions, the loop antenna position was approached to the EUT and the significant frequency of the emission's circumstance from the test system were investigated. These data were recorded in the specified frequency band (9 kHz - 30 MHz).

Step 3: Using a test receiver and a loop antenna, the emission's circumstance from the test system was measured in according with ANSI C63.4-2003 Sec.8.3.1.2 (Final Radiated Emission Measurements) at each frequency which was found the higher emission referred to level vs. frequency on the list and which was measured by the loop antenna. The maximum emission was found by rotating three orthogonal axes under a typical system configuration.

Step 4: Return to step 1, if the other operation mode was possible to be setting.

Step 5: The worst result was reported arranging data of which was obtained and performed by one or plural operation modes as the final test.

At the worst point that has the highest amplitude relative to the limit the repeatability of the level was reconfirmed. The photographs of the tests system setup on the worst point were taken and recorded.

Electromagnetic Field Radiated Emission 30 MHz - 1000 MHz:

The preliminary test was performed according to the description of ANSI C63.4-2003 Sec.8.3.1.1 (Exploratory Radiated Emission Measurements) and Sec.6.2.1 (Tabletop Equipment Tests). The preliminary test was carried out to investigate the frequency of the emission that has the highest amplitude relative to the limits within normal operating modes, cable positions, and a typical system configuration. In order to find out to the maximum emission, the preliminary test and a final test were performed in accordance with the following steps.

Step 1: One operation mode of the test system was setting.

Step 2: Using a test receiver and a test antenna probe, the significant frequency of the emission's circumstance from the test system were investigated. These data were recorded every one of 22 divided bands in the specified frequency band (30 MHz - 1000 MHz).

Step 3: Using a test receiver and a linearly polarized broadband antenna, the emission's circumstance from the test system was measured in according with ANSI C63.4-2003 Sec.8.3.1.2 (Final Radiated Emission Measurements) at each frequency which was found the higher emission referred to level vs. frequency on the list and which was measured by the linearly polarized broadband antenna. The maximum emission was found by changing the cable positions or cable manipulation under a typical system configuration.

Step 4: Return to step 1, if the other operation mode was possible to be setting.

Step 5: The worst result was reported arranging data of which was obtained and performed by one or plural operation modes as the final test.

At the worst point that has the highest amplitude relative to the limit the repeatability of the level was reconfirmed. The photographs of the tests system setup on the the worst point were taken and recorded.
