

Operational Description for Wireless Optical Mouse, FCC ID: P5AB71

Mouse: (1) Once the mouse makes a move, the IRPD will detect the glide signal and transmit the signal to MCU.

(2) The MCU converts and modulates the signal using FSK mode.

(3) The mouse transmits the modulation signal on frequency of 27 MHz.

Receiver: (1) Once the receiver receives the modulation signal, it will demodulate the signal through RF circuit and will respond with signal to MCU.

(2) The MCU meeting converts the signal into an acceptable format received by PC.
