Prediction of MPE limit at a given distance

Equation from page 18 of OET Bulletin 65, Edition 97-01

$S = PG/4\pi R^2$

Where,

S = power density (mW/cm2)
P = output power at the antenna terminal (mW)
G = gain of transmit antenna (numeric)
R = distance from transmitting antenna (cm)

Maximum peak output power at antenna input terminal = 25.79 (dBm) *
Maximum peak output power at antenna input terminal = 379 (mW)
Antenna gain (typical) = 1.4 (dBi)
Maximum antenna gain = 1.4 (numeric)
Prediction distance = 20 (cm)
Prediction frequency = 1618.78 (MHz)
MPE limit for uncontrolled exposure at prediction frequency = 1.0 (mW/cm^2)
Power density at prediction frequency = 0.1055626293 (mW/cm^2)

*Includes 1dB of manufacturer output power tolerance.

To solve for the minimum mounting distance required;

$R = \sqrt{(PG/4\pi S)}$

$R = \sqrt{(346 \times 1.4 / 4\pi \times 0.1055626293)}$ = 20 cm (Based on continuous transmission)
