**Technical Report to the FCC and IC Regarding
Johnson Controls Interiors, L.L.C. Homelink® III
Model: CB2W204HL3
FCC ID: CB2W204HL3
IC: 279B-W204HL3
1/13/2006**

A report concerning approval for Johnson Controls Homelink® model CB2W204HL3
Please issue grant immediately upon review.
Confidentiality applied to the following sections according to 47 CFR 0.459 and RSP-100:
Circuit Block Diagrams, attachment "hl_block_diag.pdf"
Theory/Description of Operation "theory_op.pdf"
Schematics attachment "schematics.pdf"

Johnson Controls Interiors, LLC.

1. General Information

1.1. Product Description:

The Johnson Controls Interiors HomeLink® HL3 Universal Garage Door Opener is a low-power transceiver OEM device that is installed into an overhead area of the automobile. The installation is provided by trained technicians during the course of the manufacture of the automobile. It is powered by the 12volt system of the automobile.

This Universal Garage Door Opener has the capability to

1. Learn the frequency and bit code format of the user's existing garage door remote control devices and
2. Reproduce and transmit the frequency and bit code format to remotely operate the user's garage door.

The unit is designed for the periodic operation of a control signal, which typically activates a garage door opener receiver.

The unit is supplied to the automobile manufacturer without harness. For testing purposes a typical assembly and 2-conductor cable harness were used to power to the unit.

The unit is only operational when the user depresses the control button. It becomes inactive after release of the control button.

The three-button HomeLink® unit replaces up to three hand-held transmitters. In addition to the typical operation of the garage door, the unit will learn the radio frequency codes of other transmitter types to activate entry door locks, estate gates, security systems, and home or office lighting.

The antenna system is an integral part of the unit. It cannot be altered nor replaced by the user. Service of this system is only available from the Automobile Manufacturer's Dealerships and Johnson Controls Interiors, LLC.

This particular Homelink® unit also interfaces with the vehicle LIN communication bus. A LIN bus keep-alive signal is required in order for the product to be activated. The need for a "keep-alive" message required modification of the part for testing.

1.2. Related Grants

None.

1.3. Test Methodology

Radiated Emissions testing was done according to ANSI C63.4-2003. The power source for this product is a 12V automotive vehicle battery, thus conducted emissions measurements are not required.

The unit is supplied to the automobile manufacturer without harness. For testing purposes a 2-conductor cable harness was used to interface to the unit.

As mentioned above, a LIN bus message is nominally required for the Homelink® to transmit. In order to prevent the test equipment from influencing test results, and to make testing practical, the LIN transceiver and channel buttons were bypassed. Activation of

the Homelink® was accomplished via fiber-optic interface with the Homelink® MCU. It is not believed that the fiber-optic communications board significantly influenced measurements.

1.4. Test Facility

The Open Area Test Site where these measurements were taken, is located on the grounds of Johnson Controls Automotive Interiors System's Edgar D. Prince Technical Campus, in the city of Holland, county of Ottawa, state of Michigan, United States of America. The site is a fully enclosed 10m weather-protected OATS. All structure materials above the conducting ground-plane are non-metallic and consist of: wood, laminated lumber, fiberglass, glue, plastic, or fiberglass reinforced plastic. The site contains a 15-foot diameter turntable capable of supporting large cars and light trucks under test. Tabletop testing was conducted on a smaller 3m turntable described in the site recertification report. The test site has been fully described in a reports filled with the FCC and Industry Canada. The report filled with the FCC is dated October 19, 1999, was accepted by the FCC in a letter dated December, 20 1999. The report filled with Industry Canada, dated January 31, 2000, was accepted via a letter dated February 29, 2000. The site was re-certified with the FCC on December 27, 2002 and with the IC on January 27, 2003. Our OATS is registered with the IC under file number IC 3593.

1.5. Accreditation

The Johnson Controls, Inc. - Electronics Validation Lab is accredited to ISO 17025 by the American Association for Laboratory Accreditation (A2LA). Our laboratory scope and accreditation certificate (#1869.01) are available from their web site www.a2la.org. Our scope of accreditation covers ANSI C63.4 Radiated Emissions at 3m, FCC 47 CFR Part 15, and IC RSS-210.

2. Product Labeling

The FCC Identifier assigned is FCC ID: CB2W204HL3. The Industry Canada certification number is 279B-W204HL3. These identifiers will be embossed on the product housing.

The label will be placed on the exterior of the HL3 housing using an acrylic adhesive that will permanently affix the label.

Because of the small size of the device and because the installation is inside a portion of the automobile, the following statements will appear in the user's manual. Refer to attachment "user_man.pdf" for the entire text of the user's manual.

"This device complies with Part 15 of the FCC rules and with RSS-210 of the Industry Canada. Operation is subject to the following two conditions:

- (1) This device may not cause harmful interference,
- (2) This device must accept any interference that may be received including interference that may cause undesired operation.

WARNING: The transmitter has been tested and complies with FCC and Industry Canada rules. Changes or modifications not expressly approved by the party responsible for the compliance could void the user's authority to operate the device."

2.1. Label Drawing and Location on Product.

The label drawing as well as a sketch of the label location on product packaging is available in "label.pdf"

3. Test Configuration

Radiated Emissions measurements presented in the report were made in accordance with ANSI C63.4 Figure 9(c). The EUT was placed on a 1 x 1.5m non-metallic table elevated 80cm above a conducting ground plane.

A picture of the radiated test setup is included below

4. Block Diagram

For system block diagram please refer to attachment named "hl_block_diag.pdf"

5. Test Setup Photographs

Test Setup End

Test Setup Side

6. Conducted Emissions Measurements

Conducted Measurements are not required for this product.

7. Radiated Emissions Data

7.1. Summary of Results

- Measurements of the transmit output field strength were taken with the DUT trained to 288, 310, and 418 MHz at 30, 50 and 80% duty cycles. A **worst-case emission of 78.9 dBuV/m** occurred with the DUT trained to 418 MHz, 50% duty cycle. The worst-case emission remained **1.4 dB below the FCC and IC limits** (75.3 dBuV/m) for this type of device.

- The **worst-case harmonic measurement of 48.2 dBuV/m** was found at 576 MHz, the second harmonic of 288 MHz at 30% duty cycle. **A margin of 5.6 dB to the prescribed limit was noted.** When adjusted for the duty cycle.
- This module exhibits pulsed operation characteristics.
- Measurements were taken of the 20dB occupied bandwidth. The transmitter had a maximum occupied bandwidth of 83 kHz when the DUT is trained to 418 MHz, 30% duty cycle.
- This device has a worst case Class B emission of 36.3 dBuV/m at 35 MHz when set to transmit at 288 MHz a margin of 3.7 dB to the Class B limit is maintained.
- The device was found to be incapable of operating in restricted bands.
- The device deactivated immediately after the activation button is depressed. Less than 5 sec.
- The device uses coarse and fine pulses to tune the transmit antenna. At 418 MHz, 30% duty cycle the field strength of the pulses average 6265 uV/m over 100 msec. This represents a margin on 3.9 dB to the FCC limit.

7.2. Test Equipment Used

<u>Description</u>	<u>Model #</u>	<u>Serial Number</u>	<u>Last Cal Date</u>	<u>Cal Due</u>
EMCO Biconical Antenna (20- 300 MHz)	3110B	9906-3309	7/15/05	7/15/07
EMCO LPA Antenna (200- 2000MHz)	3148	9908-1076	7/14/05	7/14/07
Electro-metrics Double Ridged Guide (1- 18GHz)	RGA-60	6147	10/21/03	10/21/05
A.H. Systems Bicon Antenna	SAS-540	599	8/1/05	8/1/06
Agilent E- series EMC Analyzer	E4407B	US41192569	10/18/05	10/18/06
HP Spectrum Analyzer	8591A	S919A00107	10/17/05	10/17/06

7.3. Test Equipment Setup and Procedure

Spectrum Analyzer Settings Emissions:

Detector Function: Peak

Resolution Bandwidth: 120kHz (below 1GHz)

1MHz (above 1GHz)

Video Bandwidth: 300kHz (below 1GHz)

3MHz (above 1GHz)

Spectrum Analyzer Settings Occupied Bandwidth:

Detector: Peak

Resolution Bandwidth: 3 MHz (to determine peak level)

1 kHz (to determine occupied bandwidth)

Video Bandwidth: 3 MHz (to determine peak level)

3 kHz (to determine occupied bandwidth)

For the testing, the EUT was placed at the center of a non-conducting table 80 cm above the ground plane pursuant to ANSI C63.4 for stand-alone equipment. The 2-conductor cable harness was routed to the edge of the long side of the table then down to the power supply located on the turntable base.

Equipment is placed in one of the three orthogonal orientations, End, Side, and Flat. These orientations are described below in Figure 7.3.1. (Note: There is no harness used for this product)

Figure 7.3.1 EUT Orthogonal Orientations

While in the prescribed orientation, the vertical antenna positioner sweeps in elevation from 1 to 4m in height until the operator finds the peak. The 3m turntable is then rotated through 360 degrees until a peak is found. The table is stopped at the peak location and the peak in elevation re-verified. Procedure is repeated for applicable orientations/measurement antenna polarizations.

7.4. Measured Data

7.4.1. Measurements of Fundamentals and Harmonics

Measurements described in this section were taken according to ANSI C63.4-2003 on the Johnson Controls 3m test table.

7.4.1.1. DUT Tuned to 288MHz (Fundamental)

Frequency (MHz)	Orientation (Flat/End/Side)	Measurement Polarization (H/V)	Duty Cycle (%)	Measurement* (dBuV/m)	Duty Cycle Correction (dB)	Average Level (dBuV/m)	FCC Limit (dBuV/m)	Margin (dB)
288	Side	H	30	82.27	-10.46	71.8	73.8	2.0
288	Side	H	50	78.01	-6.02	72.0	73.8	1.8
288	Side	H	80	74.28	-1.94	72.3	73.8	1.5

* Measurements include Cable corrections and Antenna Factors

7.4.1.2. DUT Tuned to 310MHz (Fundamental)

Frequency (MHz)	Orientation (Flat/End/Side)	Measurement Polarization (H/V)	Duty Cycle (%)	Measurement* (dBuV/m)	Duty Cycle Correction (dB)	Average Level (dBuV/m)	FCC Limit (dBuV/m)	Margin (dB)
309.5	Side	H	30	83.51	-10.5	73.1	75.3	2.2
309.5	Side	H	50	79.24	-6.0	73.2	75.3	2.1
309.5	Side	H	80	75.12	-1.9	73.2	75.3	2.1

* Measurements include Cable corrections and Antenna Factors

7.4.1.3. DUT Tuned to 418MHz (Fundamental)

Frequency (MHz)	Orientation (Flat/End/Side)	Measurement Polarization (H/V)	Duty Cycle (%)	Measurement* (dBuV/m)	Duty Cycle Correction (dB)	Average Level (dBuV/m)	FCC Limit (dBuV/m)	Margin (dB)
418	End	V	30	89.28	-10.5	78.8	80.3	1.5
418	End	V	50	84.89	-6.0	78.9	80.3	1.4
418	End	V	80	80.75	-1.9	78.8	80.3	1.5

* Measurements include Cable corrections and Antenna Factors

7.4.1.4. 288MHz (Harmonics)

Frequency (MHz)	Orientation (Flat/End/Side)	Measurement Polarization (H/V)	Duty Cycle (%)	Measurement* (dBuV/m)	Duty Cycle Correction (dB)	Average Level (dBuV/m)	FCC Limit (dBuV/m)	Margin (dB)

Noise

* Measurements include Cable corrections and Antenna Factors

7.4.2. Pulsed Operation

The Homelink® transmitter tested here transmits pulses using amplitude modulation with varying duty cycle. Verification of pulse operation at 30, 50 and 80% duty cycles is provided here. Measurements were taken at 288MHz with the span set to zero on the E7407B spectrum analyzer.

7.4.2.1. 30% Duty Cycle

7.4.2.2. 50% Duty Cycle

7.4.2.3. 80% Duty Cycle

7.4.3. Occupied Bandwidth

Occupied bandwidth measurements were taken at 288, 310, and 418 MHz. The occupied bandwidth was determined using the 20dB measurement method.

7.4.3.1. Occupied Bandwidth Measurement

Frequency (MHz)	Duty Cycle (%)	Occupied Bandwidth (kHz)	Limit (kHz)
288	30	70	720
	50	70	720
	80	70	720
310	30	83	775
	50	75	775
	80	75	775
418	30	70	1045
	50	70	1045
	80	60	1045

7.4.3.2. Example of Occupied Bandwidth measurement (288MHz 30% Duty Cycle)

Measuring Occupied Bandwidth at -20dB points

7.4.4. Emission Spectrum

Prescan Measurements were taken inside a semi-anechoic chamber to investigate the possibility of other spurious emissions from the DUT.

Emissions were noted and measured on the JCI OATS, all measurements were found to be near or below the ambient noise level and well below the FCC and IC limits for spurious emissions. A summary is presented below in section 7.4.4.4

Measurement settings:
Resolution BW 120kHz
Video Bandwidth: 300kHz
Detector: Peak

Note: Pre-scan measurements were made in a semi-anechoic chamber using a HP8591 spectrum analyzer and AR LN1000 Pre-amplifier .

7.4.4.1. Summary of Emissions Measurements Taken on OATS

Measurements were made using a peak detector with Resolution BW of 120 kHz and Video BW of 300 kHz. Cable losses and correction factors included in measurement.

TX Freq. (MHz)	Emission Frequency (MHz)	Measurement (dBuV/m)	Limit (dBuV/m)	Margin (db)
288	35	36.27	40	3.7
	60	24.64	40	15.4
	75	20.87	40	19.1
	81.32	20.2	40	19.8
	85	25.94	40	14.1
	91.44	62.38	40	N/A
	95	31.53	40	N/A
310	48.48	24.48	40	15.5
	54.28	28.41	40	11.6
	80	23.09	40	16.9
	174.52	43.41	40	N/A
	232.68	35.49	40	N/A

	54.28	35.56	40	4.4
	60	24.41	40	15.6
	65	24.4	40	15.6
	81	24.1	40	15.9
	135	25.33	40	14.7

Local Ambient prevents accurate measurement

7.4.4.2. Plot of Class B Emissions relative to FCC Limit

7.4.5. Variation of Supply Voltage

The supply voltage was varied from 50% to 150% of normal supply voltage (12V). It should be noted that while the data indicates operation below 7.5 V, this is not a common occurrence for the Homelink® series of Universal Garage Door Openers and is likely an artifact of the configuration used for testing. Inside the normal band of operation the power output increase by less than 0.5 dB.

Voltage	Field Strength (dBuV/m)
6	67.88
7	70.03
8	82.29
9	82.41
10	82.26
11	82.28
12	82.09
13	82.08
14	82.25
15	82.18
16	82.15

7.4.6. Verification of Non-Operation in Restricted Bands

An exercise was undergone to verify that the device was not able to learn and thereby transmit in a restricted band. During this exercise it was found that the device firmware prevents the device from learning any frequency within 1MHz of any restricted band listed in 47 CFR 15.205 and RSS-210, Table 1.

7.4.7. Verification of De-activation after 5 seconds

This device stops transmitting once the activation button is depressed.

7.4.8. Tuning Pulse Measurements

This device uses pulses to tune the antenna prior to transmission. Measurements of these tuning pulses over 100 msec windows show that these pulses are below the FCC limits for operation in this band. A summary of measurements is presented in section 7.4.8.7. Tuning pulse measurements were taken at 288, 310, and 418 MHz at a duty cycle of 30%. Settings in the screen capture below were not used to make the measurements presented in section 7.4.8.7.

7.4.8.1. Coarse Tuning Pulse (288MHz)

7.4.8.2. Fine Tuning Pulse (288MHz)

7.4.8.3. Coarse Tuning Pulse (310MHz)

Coarse Tuning Pulse, 310 MHz, 30% Duty Cycle

7.4.8.4. Fine Tuning Pulse (310MHz)

Fine Tuning Pulse, 310 MHz, 30% Duty Cycle

7.4.8.5. Coarse Tuning Pulse (418 MHz)

7.4.8.6. Fine Tuning Pulse (418MHz)

7.4.8.7. Summary of Tuning Pulse Measurements

Measurement Settings:

Resolution Bandwidth: 1MHz

Video Bandwidth: 3 MHz

Sweep Time: 400 msec.

For this measurement 4000 points were recorded and the values averaged over 100 msec. windows that captured either the coarse or fine tuning pulses.

Coarse	Frequency (MHz)	Average (uV/m)	Limit (uV/m)	Margin (dB)
	288	1174	4915	12.4
	310	1930	5831	9.6
	418	6265	9806	3.9

Fine	Frequency (MHz)	Average (uV/m)	Limit (uV/m)	Margin (dB)
	288	231	4915	26.5
	310	382	5831	23.7
	418	898	9806	20.8

7.5. Formulas and Sample Calculations

7.5.1. Adjustment to account for duty cycle

The spectrum analyzers used for making the measurements in this report automatically corrects for cable correction and antenna factors using values stored in memory taken from the most recent calibration (in the case of antenna factors) and periodic cable loss measurements.

Formula 1: $FS(dBuV/m) = M(dBuV) + AF(dB/m) + CF(dB)$

The presented field strength is computed by the spectrum analyzer by taking the measured level and adding to it the antenna factor and cable loss corrections. The measurement presented is gathered using the spectrum analyzer's peak-hold capability.

Formula 2: $Average\ Level(dBuV/m) = Peak\ Level\ (dBuV/m) + duty\ cycle\ factor(dB)$.

The peak measurement is adjusted to an average level by a duty cycle described below.

The duty cycle factor to apply is determined for the duty cycles of 30%, 50%, and 80% as follows:

For 30% (0.30): $duty\ cycle\ factor(dB) = 20 * \log(0.3) = -10.46$

For 50% (0.50): $duty\ cycle\ factor(dB) = 20 * \log(0.5) = -6.02$

For 80% (0.80): $duty\ cycle\ factor(dB) = 20 * \log(0.8) = -1.94$

Example calculation:

With the EUT programmed with a 30% duty cycle a measurement of 74 dBuV/m is taken (about 5000 uV/m), the adjusted level would be:

$$74 + (-10.46) = 63.54\ dBuV/m\ \text{(example)}$$

7.5.2. Calculation of FCC limits from 15.231 and RSS-210.

The prescribed limit in the range of 260 MHz to 470 MHz is stated as a linear interpolation between 3750 uV/m and 12500 uV/m. The equation used to calculate the limit using this criteria is:

$$\text{FCC/IC limit} = 41.67 * f - 7083.33$$

(Where 'f' is the measurement frequency in MHz.)

The limit in dBuV/m is then:

$$\text{dB limit} = 20 * \log_{10}(\text{FCC limit uV/m}) = 20 * \log_{10}(41.67 * f - 7083.33)$$

(log10 is used to indicate the use of a base 10 logarithm)

This results in the following limits for the fundamentals:

288MHz	$20 * \log_{10}(4917.6) = 73.8 \text{ dBuV/m}$
310MHz	$20 * \log_{10}(5834.4) = 75.3 \text{ dBuV/m}$
390MHz	$20 * \log_{10}(9168.0) = 79.2 \text{ dBuV/m}$
418MHz	$20 * \log_{10}(10334.7) = 80.3 \text{ dBuV/m}$

9.2. Theory of Operation

Stand Alone HomeLink® Module Description of Operation

The HomeLink® transmitter is a radio frequency transceiver device whose primary function is to determine both frequency and bit code format of typical garage door remote control devices and identically re-transmit them to the original garage door opener receiver.

The on-board microcontroller maintains the operational frequency band as 288MHz to 420MHz, excluding forbidden bands of 303.5 to 305.5MHz, 322 to 335.4MHz and 399.9 to 410 MHz by at least 1 MHz spacing.

The “training” operation is performed by scanning the legal frequencies with a single conversion superheterodyne receiver, looking for valid garage door opener bit code formats. After the training sequence, the frequency, bit code and attenuator setting is stored in non-volatile memory (NVM). The IF of the superheterodyne receiver section is 10.7MHz.

On subsequent power ups, the NVM data is recalled. The VCO is set on the desired RF carrier frequency. The antenna is coarse tuned by sweeping twice around the expected tuning point. It is then fine tuned with 9 pulses. The voltage controlled oscillator (VCO) is then modulated with the appropriate garage door opener bit code from the NVM.

In addition to being frequency and data format adaptive. The HomeLink® transmitter also adjusts the RF amplitude level based upon the duty cycle. During the training sequence, the duty factor of the incoming bit code format is evaluated by the microcontroller determining the greatest amount of on-time in a 100 mS window. The duty factor is then used to adjust the output power in a range of 80% (1.9 dB) to a maximum limit to 30% (10.5 dB) duty cycle. A 9 bit attenuator is adjusted by a closed loop power control algorithm in the microcontroller.

Also, the microcontroller adjusts the output level as a result of the learned frequency of operation. The firmware maintains information relative to the allowable field intensity limits. As the allowable limit increase with frequency of operation the microcontroller adjusts the output level to increase with the increase in transmit frequency.

9.3. Emission Designation

According to TRC-43, the emission designation for this product is 83KL1D. Where “83K” is the highest measured occupied bandwidth (83 kHz), “L” indicates the device uses pulse width modulation, “1” indicates the modulation as being single channel, digital information and “D” indicates that data is being transmitted.

9.4. Schematics/ Tuning Information

Programming the Homelink © III (Tuning Information)

To clear memory:

1. Press the two outside buttons until the indicator LED flashes. This indicates the memory values have been cleared.
2. Holding the hand-held transmitter to be copied 3-6 inches from the Homelink © III and simultaneously, activate the hand-held transmitter and one of the Homelink © III buttons until the indicator LED flashes rapidly. The frequency and bit pattern information are now stored in the Homelink © III non-volatile memory (NVM). At this point the Homelink © III can be used as a substitute from for the Original transmitter.

When a Homelink © III button is pressed four things happen:

1. A Voltage Controlled Oscillator (VCO) is set to desired RF carrier frequency (recalled from the NVM).
2. The antenna is coarse tuned by sweeping twice around the expected tuning point.
3. The antenna is fine tuned by 9 pulses of approximately 210 uS in duration with 11 mS off.
4. The VCO is then modulated with the appropriate garage door opener bit code from the NVM.
