1 Subject of Investigation and Test Results

The tested KX-TGCA35 is a new handset from Panasonic Corporation operating in DECT standard with one integrated antenna.

The objective of the measurements performed by IMST is the dosimetric assessment of DECT on one device in the intended use positions.

1.1 Technical Data of DUT

Product Specifications		
Manufacturer	Panasonic Corporation	
Model Under Test	KX-TGCA35 (refer to chapter 1.2)	
SN / IMST DUT No.	N/A / SAR 01	
Operation Mode	DECT	
Frequency Range	1921.536 – 1928.448 MHz	
Modulation	GFSK	
Maximum Duty Cycle	4.17 %	
Antenna Type	1x internal (IFA)	
Maximum Output Power	refer chapter 7.3	
Power Supply	2x NiMH 1.2 V (DC 2.4V)	
Used Accessory	N/A	
DUT Stage	production unit	⊠ identical prototype
Notes:		

1.2 Product Family / Model Variants

As declared by the manufacturer, there are different model variants available. All following model name variants have identical RF design and antennas with the tested variant KX-TGCA35.

Model Variants	
Manufacturer	Panasonic Corporation
Model Under Test	KX-TGCA35
Identical Model Variants	KX-TGCA36; KX-TGCA38AC

1.3 Antenna Configuration

3 Exposure Criteria and Limits

3.1 SAR Limits

Human Exposure Limits				
Condition	Uncontrolled Environment (General Population)		Controlled Environment (Occupational)	
	SAR Limit [W/kg]	Mass Avg.	SAR Limit [W/kg]	Mass Avg.
SAR averaged over the whole body mass	0.08	whole body	0.4	whole body
Peak spatially-averaged SAR for the head, neck & trunk	1.6	1g of tissue*	8.0	1g of tissue*
Peak spatially-averaged SAR in the limbs	4.0	10g of tissue*	20.0	10g of tissue*
Note: *Defined as a tissue volume in the shape of a cube				

Table 1: SAR limits specified in IEEE Standard C95.1-2005 and Health Canada's Safety Code 6.

In this report the comparison between the exposure limits and the measured data is made using the spatial peak SAR; the power level of the device under test guarantees that the whole body averaged SAR is not exceeded.

3.2 Exposure Categories

General Public / Uncontrolled Exposure

General population comprises individuals of all ages and of varying health status, and may include particularly susceptible groups or individuals. In many cases, members of the public are unaware of their exposure to electromagnetic fields. Moreover, individual members of the public cannot reasonably be expected to take precautions to minimize or avoid exposure.

The occupationally exposed population consists of adults who are generally exposed under known conditions and are trained to be aware of potential risk and to take appropriate precautions.

Table 2:RF exposure categories.

3.3 Distinction between Maximum Permissible Exposure and SAR Limits

The biological relevant parameter describing the effects of electromagnetic fields in the frequency range of interest is the specific absorption rate SAR (dimension: power/mass). It is a measure of the power absorbed per unit mass. The SAR may be spatially averaged over the total mass of an exposed body or its parts. The SAR is calculated from the r.m.s. electric field strength *E* inside the human body, the conductivity σ and the mass density ρ of the biological tissue:

$$SAR = \sigma \frac{E^2}{\rho} = c \frac{\partial T}{\partial t} \bigg|_{t \to 0+}$$
 (1)

The specific absorption rate describes the initial rate of temperature rise $\partial T / \partial t$ as a function of the specific heat capacity *c* of the tissue. A limitation of the specific absorption rate prevents an excessive heating of the human body by electromagnetic energy.

As it is sometimes difficult to determine the SAR directly by measurement (e.g. whole body averaged SAR), the standard specifies more readily measurable maximum permissible exposures in terms of external electric E and magnetic field strength H and power density S, derived from the SAR limits. The limits for E, H and S have been fixed so that even under worst case conditions, the limits for the specific absorption rate SAR are not exceeded.

4 The Measurement System

DASY is an abbreviation of <u>"D</u>osimetric <u>A</u>ssessment <u>Sy</u>stem" and describes a system that is able to determine the SAR distribution inside a phantom of a human being according to different standards. The DASY4 system consists of the following items as shown in Fig: 2. Additionally, Fig: 3 shows the equipment, similar to the installations in other laboratories.

- Fully compliant with all current measurement standards as stated in Fig. 4
- High precision robot with controller
- Measurement server (for surveillance of the robot operation and signal filtering)
- Data acquisition electronics DAE (for signal amplification and filtering)
- Field probes calibrated for use in liquids
- Electro-optical converter EOC (conversion from the optical into a digital signal)
- Light beam (improving of the absolute probe positioning accuracy)
- Two SAM phantoms filled with tissue simulating liquid
- DASY4 software
- SEMCAD

Fig. 2: The DASY4 measurement system.

Revision Date:

Fig. 3: The measurement set-up with a DASY system and phantoms containing tissue simulating liquid.

The DUT operating at the maximum power level is placed by a non-metallic device holder (delivered from Schmid & Partner) in the above described positions at a shell phantom of a human being. The distribution of the electric field strength *E* is measured in the tissue simulating liquid within the shell phantom. For this miniaturised field probes with high sensitivity and low field disturbance are used. Afterwards the corresponding SAR values are calculated with the known electrical conductivity σ and the mass density ρ of the tissue in the SEMCAD FDTD software. The software is able to determine the averaged SAR values (averaging region 1 g or 10 g) for compliance testing.

The measurements are done by two scans: first a coarse scan determines the region of the maximum SAR, afterwards the averaged SAR is measured in a second scan within the shape of a cube.

4.1 Phantoms

TWIN SAM PHANTOM V4.0		
· · · · · · · · · · · · · · · · · · ·	Specific Anthropomorphic Mannequin delivered by Schmid & Partner Engineering AG. It enables the dosimetric evaluation of left and right hand phone usage as well as body mounted usage at the flat phantom region. The details and the Certificate of conformity can be found in Fig. 5 on page 27.	
Shell Thickness	2 ± 0.2 mm (6 ± 0.2 mm at ear point)	
Dimensions	Length: 1000 mm; Width: 500 mm Height: adjustable feet	
Filling Volume	approx. 25 liters	

ELI PHANTOM V4.0		
	Phantom for compliance testing of handheld and body-mounted wireless devices in the frequency range of 30 MHz to 6 GHz. The details and the Certificate of conformity can be found in Fig. 11 on page 28.	
Shell Thickness	2.0 ± 0.2 mm (bottom plate)	
Dimensions	Major axis: 600 mm Minor axis: 400 mm	
Filling Volume	approx. 30 liters	

4.2 E-Field-Probes

For the measurements the Dosimetric E-Field Probes ET3DV6R or EX3DV4 with following specifications are used. They are manufactured and calibrated in accordance with FCC and IEC/IEEE 62209-1528 recommendations by Schmid & Partner Engineering AG.

ET3DV6R		
Construction	Symmetrical design with triangular core Built-in optical fiber for surface detection system (ET3DV6 only) Built-in shielding against static charges PEEK enclosure material (resistant to organic solvents, e.g., DGBE)	
Dimensions	Overall length: 337 mm (Tip: 16 mm) Tip diameter: 6.8 mm (Body: 12 mm) Distance from probe tip to dipole centers: 2.7 mm	
Frequency	10 MHz to 2.3 GHz Linearity: ± 0.2 dB (30 MHz to 2.3 GHz)	
Directivity	Axial isotropy: \pm 0.2 dB in TSL (rotation around probe axis) Spherical isotropy: \pm 0.4 dB in TSL (rotation normal to probe axis)	
Dynamic Range	5 μ W/g to > 100 mW/g; Linearity: ± 0.2 dB	
Calibration Range	450 MHz / 750 MHz / 835 MHz / 1750 MHz / 1900 MHz	

EX3DV4

EA3DV4		
Construction	Symmetrical design with triangular core Built-in shielding against static charges PEEK enclosure material (resistant to organic solvents, e.g., DGBE)	
Dimensions	Overall length: 337 mm (Tip: 20 mm) Tip diameter: 2.5 mm (Body: 12 mm) Typical distance from probe tip to dipole centers: 1 mm	
Frequency	10 MHz to > 6 GHz Linearity: \pm 0.2 dB (30 MHz to 6 GHz)	
Directivity	Axial isotropy: ± 0.3 dB in TSL (rotation around probe axis) Spherical isotropy: ± 0.5 dB in TSL (rotation normal to probe axis)	
Dynamic Range	10 μW/g to > 100 mW/g Linearity: ± 0.2 dB (noise: typically < 1 μW/g)	
Calibration Range	150 MHz / 300 MHz / 450 MHz / 2450 MHz / 2600 MHz / 5250 MHz / 5600 MHz / 5800 MHz	

5 Measurement Procedure

5.1 General Requirement

The test shall be performed in a laboratory with an environment which avoids influence on SAR measurements by ambient EM sources and any reflection from the environment itself. The ambient temperature shall be in the range of 20°C to 26°C and 30-70% humidity. All tests have been conducted according the latest version of all relevant KDBs.

5.2 Test Position of DUT operating next to the Human Ear

5.2.1 Phantom Requirements

The phantom is a simplified representation of the human anatomy and comprised of material with electrical properties similar to the corresponding tissues. The physical characteristics of the phantom model shall resemble the head and the neck of a user since the shape is a dominant parameter for exposure.

5.2.2 Reference Points

As it cannot be expected that the user will hold the mobile phone exactly in one well defined position, different operational conditions shall be tested. The standards require two test positions. For an exact description helpful geometrical definitions are introduced and shown in Fig. 4 - 5. There are two imaginary lines on the mobile, the vertical centerline and the horizontal line. The vertical centerline passes through two points on the front side of the handset: the midpoint of the width wt of the handset at the level of the acoustic output (point A) and the midpoint of the width w_b of the bottom of the handset (point B) on Fig. 4 and 5. The horizontal line is perpendicular to the vertical centerline and passes through the center of the acoustic output. The horizontal line is also tangential to the face of the handset at point A. The two lines intersect at point A.

Reference lines on a full touch screen smart phone. Fig. 4:

Fig. 5:

Reference lines on a keyboard handset.

Fig. 6: Phantom reference points.

According to Fig. 6 the human head position is given by means of the following three reference points: auditory canal opening of both ears (RE and LE) and the center of the closed mouth (M). The ear reference points are 15 - 17 mm above the entrance to the ear canal along the BM line (back-mouth), as shown in Fig. 6. The plane passing through the two ear canals and M is defined as the reference plane. The line NF (Neck-Front) perpendicular to the reference plane and passing through the RE (or LE) is called the reference pivoting line. Line BM is perpendicular to the NF line. With this definitions the test positions are given by cheek and tilted position.

5.2.3 Cheek Position

- 1. The NF line is the plane defined by the handset vertical and horizontal line
- 2. The vertical centreline from the handset is in the reference plane
- 3. Position the handset close to the surface of the phantom such that point A meets the line through the reference points (RE) and (LE) (see Fig. 7)
- 4. Move the handset towards the phantom along the line through RE and LE until point A touches the pinna at RE or LE
- 5. While keeping point A on the line through LE and RE and maintaining the handset in contact with the pinna, rotate it about the NF line until any point on the handset is in contact with the phantom below the pinna

Revision Date:

5.2.4 Tilted Position:

Fig. 8: The tilted position.

- 1. Repeat the above steps for the cheek position
- 2. While maintaining the orientation of the handset, remove the handset from the pinna along the RE LE line until a free rotation of the handset around the horizontal line is possible
- 3. Rotate the handset by 15° and move it back along the RE- LE line until any part touches the ear
- 4. For the case that contact occurs at any position other than the pinna, the rotation should be reduced so that the device has contact with the ear and any additional point of the phantom

5.2.5 Test to be Performed

The SAR test shall be performed with both phone positions described above, on the left and right side of the phantom. The device shall be measured for all modes operating when the device is next to the ear, even if the different modes operate in the same frequency band.

For devices with retractable antenna the SAR test shall be performed with the antenna fully extended and fully retracted. Other factors that may affect the exposure shall also be tested. For example, optional antennas or optional battery packs which may significantly change the volume, lengths, flip open/closed, etc. of the device, or any other accessories which might have the potential to considerably increase the peak spatial-average SAR value.

The SAR test shall be performed at the high, middle and low frequency channels of each operating mode.

M

5.3 Measurement Procedure

The following steps are used for each test position:

- Establish a call with the maximum output power with a base station simulator. The connection between the mobile phone and the base station simulator is established via air interface.
- Measurement of the local E-field value at a fixed location (P1). This value serves as a reference value for calculating a possible power drift.
- Measurement of the SAR distribution with resolution settings for area scan and zoom scan according IEC/IEEE 6209-1528 as shown in Table 3.
- The used extrapolation and interpolation routines are all based on the modified Quadratic Shepard's method [DASY4].
- Repetition of the E-field measurement at the fixed location (P1) and repetition of the whole procedure if the two results differ by more than ± 0.21dB.

Area So	an				
Parameter	f ≤ 3 GHz	3 GHz < f ≤ 10 GHz			
Maximum distance from closest measurement point (geometric center of probe sensors) to phantom surface	5 ± 1 mm	½·δ·ln(2) ± 0.5 mm			
Maximum spacing between adjacent measured points in mm	20, or half of the corresponding zoom scan length, whichever is smaller	60/f, or half of the corresponding zoom scan length, whichever is smaller			
Maximum angle between the probe axis and the phantom surface	$5^{\circ} \pm 1^{\circ}$ (flat phantom) $5^{\circ} \pm 1^{\circ}$ (flat phantom) $30^{\circ} \pm 1^{\circ}$ (other phantoms) $20^{\circ} \pm 1^{\circ}$ (other phantoms)				
Zoom	Scan				
Maximum distance between the closest measured points and the phantom surface	5 mm	½·δ In(2) ^a			
Maximum angle between the probe axis and the phantom surface	$5^{\circ} \pm 1^{\circ}$ (flat phantom) $30^{\circ} \pm 1^{\circ}$ (other phantoms)	$5^{\circ} \pm 1^{\circ}$ (flat phantom) 20° ± 1°(other phantoms)			
Maximum spacing between measured points in the x- and y-directions (Δx and $\Delta y)$	8 mm	24/f ^b			
Uniform grid: ΔZ_1 Maximum spacing between measured points in the direction normal to the phantom shell	5 mm	10/(f - 1)			
Minimum edge length of the zoom scan volume in the x- and y-directions (L_z in O.8.3.2)	30 mm	22 mm			
Minimum edge length of the zoom scan volume in the direction normal to the phantom shell (L_h in O.8.3.2 in mm)	30 mm	22 mm			
Note: $\begin{bmatrix} a \\ \delta \end{bmatrix}$ is the penetration depth for a plane-wave incident norm $\begin{bmatrix} b \end{bmatrix}$ This is the maximum spacing allowed, which might not we	ally on a planar half-space. ork for all circumstance

6.4 Tissue Simulating Liquid Parameters

For the measurement of the following parameters the Speag DAK-3.5 dielectric probe kit is used, representing the open-ended coaxial probe measurement procedure.

Recommended values for the dielectric parameters of the tissue simulating liquids are given in IEEE 1528 and FCC published RF Exposure KDB Procedures. All tests were carried out using liquids with dielectric parameters within +/- 5% of the recommended values. The dielectric properties of the tissue simulating liquid have been measured within 24 h before SAR testing. The depth of the tissue simulant was at least 15.0 cm for all system check and device tests, measured from the ear reference point in case of the SAM phantom and from the inner surface of the flat phantom.

	Tissue Simulating Liquids Parameters												
	Ambient Tempe	Liquid Ten	nperature(C)	: 22.0 ± 2	Humi	Humidity(%) : 40.0 ± 5

Table 7:Parameters of the head tissue simulating liquid.

6.5 Simplified Performance Checking

The simplified performance check was realized using the dipole validation kit. The input power of the dipole antenna was 250 mW (CW) and it was placed under the flat part of the SAM phantom. The target and measured results are listed in the Table 8 and shown in Appendix C - System Verification Plots. The target values were adopted from the calibration certificates found also in the appendix.

System Check Results											
Frequency [MHz]	Dipole #SN	Measured			Target		Delta

Notes: -	Notes: -										

Table 11:Conducted output power values.

7.4 Standalone SAR Test Exclusion according to KDB 447498

SAR test exclusion is determined for the DUT according to KDB 447498 D01 with 1g SAR exclusion thresholds for 100 MHz to 6GHz at test separation distances \leq 50 mm determined by:

[(max power of channel. incl. tune-up tolerance. mW) / (min test separation distance. mm)] * [$\sqrt{f(GHz)}$]

 \leq 3.0 for 1g SAR and \leq 7.5 for 10g extremity SAR, where

- f(GHz) is the RF channel transmit frequency in GHz
- Power and distance are rounded to the nearest mW and mm before calculation
- The result is rounded to one decimal place for comparison

When the minimum test separation distance is < 5 mm, a distance of 5 mm is applied to determine SAR test exclusion.

	Standalone SAR Test Exclusion Consideration (FCC)												
Mode	Freq.	Distance	nce Output Power (peak		Maximum Output Power Duty Cycle (average)		Threshold Comparison	Exclusion Threshold	SAR Testing	Estimated	SAR Testing		
moue	[MHz]	[mm]	[dBm]	[mW]	[%]	[dBm]	[mW]	Value	SAR 1g	Exclusion	SAR values	Required	
DECT	1925	5	20.0	100.00	4.17	6.20	4.17	1.1	≤ 3.0	YES	measured	NO	
Notes:													

Table 12: SAR test exclusion for the applicable transmitter according to KDB 447498.

When the standalone SAR test exclusion applies to an antenna that transmits simultaneously with other antennas the standalone SAR must be estimated according to KDB 447498 in order to determine simultaneous transmission SAR test exclusion:

 (max. power of channel. including tune-up tolerance. mW)/(min. test separation distance. mm)]·[√f(GHz)/x] W/kg for test separation distances ≤ 50 mm;

where x = 7.5 for 1-g SAR and x = 18.75 for 10-g SAR

When the minimum test separation distance is < 5 mm, a distance of 5 mm is applied to determine SAR test exclusion.

• 0.4 W/kg for 1g SAR and 1.0 W/kg for 10g SAR. when the test separation distance is > 50 mm

7.5 SAR Test Exclusion Consideration according to RSS-102

	Standalone SAR Test Exclusion Consideration (ISED)												
Mode	Freq.	Distance Output Power (peak)		: Power ak)	Maximum Output Power Duty Cycle (average)		Power rage)	Exemption Limit for	SAR Testing	SAR Testing			
	[MHz]	[mm]	[dBm]	[mW]	[%]	[dBm]	[mW]	SAR 1g [mW]	Exclusion	Required			
DECT	1925	5	20.0	100.0	4.17	6.2	4.17	7.0	YES	NO			
Notes:

7.6 SAR Measurement Results

SAR assessment was conducted in the worst case configuration with output power values according to the tables in Chapter 7.3. According to KDB 447498 D01, the reported SAR is the measured SAR value adjusted for maximum tune-up tolerance limit shown in Table 10.

Reported SAR is calculated by the following formulas:

- Scaling factor tune up limit = tune-up limit power (mW) / RF power (mW)
- Scaling factor max. duty cycle = max. possible duty cycle / used duty cycle for SAR measurement
- Reported SAR = measured SAR * scaling factor tune up limit * scaling factor max. duty cycle

The plots with the highest measured SAR values are shown in Appendix B - SAR Distribution Plots.

7.6.1 SAR Measurement Results

	SAR Measurement Results in Head Configuration													
Band / Antenna	Frea.	CII	DUT	Gap	Pic.	Measured	Power	Power [c	IBm]	Tune-Up	Reported	Plot
