RF Exposure evaluation

According to 447498 D01 General RF Exposure Guidance v06

The 1-g and 10-g SAR test exclusion thresholds for 100 MHz to 6 GHz at test separation distances ≤ 50 mm are determined by:

[(max_power_of_changel_including type_up_telerance_m)//(min_test_changel_including type_up_telerance_m)//(min_test_changel_including type_up_telerance_m)//(min_test_changel_including type_up_telerance_m)//(min_test_changel_including type_up_telerance_m)//(min_test_changel_including type_up_telerance_m)//(min_test_changel_including type_up_telerance_up_

[(max. power of channel, including tune-up tolerance, mW)/(min. test separation distance, mm)] $\cdot [\sqrt{f(GHz)}] \le 3.0$ for 1-g SAR and ≤ 7.5 for 10-g extremity SAR, where f(GHz) is the RF channel transmit frequency in GHz Power and distance are rounded to the nearest mW and mm before calculation The result is rounded to one decimal place for comparison

EDR

Worse case output power is as below: [2402MHz: 5.18dBm]

Maximum Gain is 0.64dBi

Maximum EIRP is 5.82dBm (3.82mW).

(3.82mW /5mm)·[√2.402(GHz)]= 1.18<3.0 for 1-g SAR

Then SAR evaluation is not required.
