**Tested devices:** Phone: PDNNEM-4, Battery: BL-5C  
(Detailed information for each device is listed in section 1).

**Supplement reports:** -

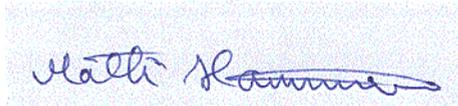

**Testing has been carried out in accordance with:** FCC CFR. 47, Part 2.1093 and IEEE 1528-200X Draft CBD 1.0  
Recommended Practice for Determining the Peak Spatial-Average Specific Absorption Rate (SAR) in the Human Body Due to Wireless Communications Devices:  
Experimental Techniques and FCC OET Bulletin 65, Supplement C, Edition 01-01.

**Documentation:** The documentation of the testing performed on the tested devices is archived for 15 years at TCC Salo.

**Test results:** **The tested device complies with the requirements in respect of all parameters subject to the test.**  
The test results and statements relate only to the items tested.

**Date and signatures:** 2003-05-14

For the contents:

## 1. SUMMARY FOR SAR TEST REPORT

|                            |   |
|----------------------------|---|
| Date of receipt            | 01.04.2003  |
| Date of test               | 08.04. – 09.04.2003   |
| Contact person             | Pasi Vainio   |
| Test plan referred to      | DTX03794-EN   |
| FCC ID                     | PDNNEM-4  |
| SN, HW, SW and DUT numbers | Phone: PDNNEM-4<br>SN: 004400/21/170112/1, HW: B5.1 (ID 0515),<br>SW: 1.94, DUT: 06407  |
| Accessories                | Battery: BL-5C, DUT #'s: 06365, 06366, 06389<br>MMC-card: DTS-64, DUT: 06391<br>Stereo Headset: HDD-2, HW: 1.0, DUT: 06391<br>Mono Headset: HDC-5, DUT: |
| Notes                      | All tests were performed in GSM1900 voice call mode or GPRS 2-slot mode at maximum power level.   |
| Document code              | SAR0315_04  |
| Responsible test engineer  | Virpi Tuominen  |
| Measurement performed by   | Arto Hihnala  |

### 1.1 Maximum Results Found during SAR Evaluation

The equipment is deemed to fulfill the requirements if the measured values are less than or equal to the limit.

#### 1.1.1 Head Configuration / GSM 1900

| Ch / f (MHz) | Power EIRP | Position / Options                          | Limit    | Measured  | Result        |
|--------------|------------|---|----------|-----------|---------------|
| 512 / 1850   | 29.4 dBm   | Right Cheek Position / MMC-card / Bluetooth | 1.6 mW/g | 0.24 mW/g | <b>PASSED</b> |

#### 1.1.2 Body Worn Configuration / GSM 1900 + GPRS (2-slot TX)

| Ch / f (MHz) | Power EIRP | Accessory / Options          | Separation distance | Limit    | Measured  | Result        |
|--------------|------------|------------------------------|---------------------|----------|-----------|---------------|
| 512 / 1850   | 29.4 dBm   | HDD-2 / MMC-card / Bluetooth | 15 mm               | 1.6 mW/g | 0.47 mW/g | <b>PASSED</b> |

### 1.1.3 Measurement Uncertainty

|                                     |              |
|-------------------------------------|--------------|
| Combined Standard Uncertainty       | $\pm 14.4\%$ |
| Expanded Standard Uncertainty (k=2) | $\pm 28.8\%$ |

## 1.2 EIRP Measurements

The measurement of the EIRP from the PDNNEM-4 phone was performed in test laboratory TCC Tampere.

TCC Tampere  
Sinitaival 5  
FIN-33720 Tampere

Finland

Fax. +358 7180 46880

Report#: NEM4\_501.pdf

## 2. DESCRIPTION OF THE TESTED DEVICE(S)

### 2.1 Device description

|                                   |                                   |               |           |
|-----------------------------------|-----------------------------------|---------------|-----------|
| FCC ID Number                     | PDNNEM-4                          |               |           |
| RF Exposure Limits                | General population / Uncontrolled |               |           |
| Unit type                         | Prototype unit                    |               |           |
| Case type                         | Fixed case                        |               |           |
| Modes of Operation                | GSM 1900                          | GPRS          | Bluetooth |
| Modulation Mode                   | GMSK                              | GMSK          | GFSK      |
| Duty Cycle                        | 1/8                               | 2/8           |           |
| Maximum Device Rating             | Power class 1                     | Power class 1 |           |
| Transmitter Frequency Range (MHz) | 1850.2 - 1909.8                   |               | 2402-2480 |

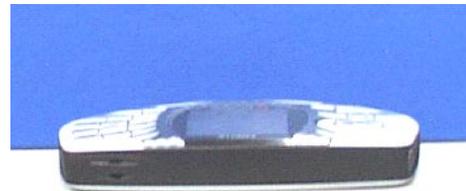

Acronyms: GMSK = Gaussian Minimum Shift Keying  
GFSK = Gaussian Frequency Shift Keying

Outside of USA, transmitter of tested device is capable of transmitting also in GSM 900 and GSM 1800 modes, which are not part of this filing.

### 2.2 Picture of Phone

NEM-4, keyboard upwards side.

Earpiece ↑

Nem-4, earpiece on slim

### 2.3 Description of the Antenna

|          |   |
|----------|---|
| Type     | PIFA  |
| Location | PIFA: inside the back cover at the top of the device. |

### 2.4 Battery Options

There is only one battery available for the tested device, a rechargeable, Li-ion battery BL-5C.

---

## 2.5 Accessories

The following accessories are tested:

- Stereo Headset HDD-2
- Mono Headset HDC-5
- MMC-card DTS-64

## 2.6 Body Worn Accessories

The body worn measurements were made with 15 mm separation distance.

### 3. DESCRIPTION OF THE TEST EQUIPMENT

#### 3.1 Automated near-field scanning system

The measurements were performed with an automated near-field scanning system, DASY3 manufactured by Schmidt & Partner Engineering AG (SPEAG) in Switzerland.

Schmidt & Partner Engineering AG (SPEAG)  
Zeughausstrasse 43  
8004 Zurich, Switzerland

Tel. +41 1 245 97 00  
Fax. +41 1 245 97 79  
[www.speag.com](http://www.speag.com)

#### 3.2 Robot

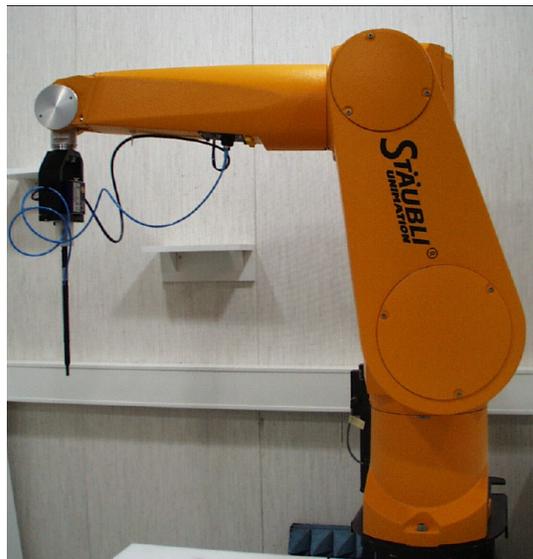

Fig. 3.2.1. Robot RX90L.

The robot is a RX90L manufactured by Staubli France, [www.staubli.com](http://www.staubli.com).

### 3.3 Isotropic E-field probe ET3DV6R

|               |   |
|---------------|---|
| Serial number | 1396  |
| Frequency     | 10 MHz to 3 GHz   |
| Linearity     | ± 0.2 dB  |
| Directivity   | ± 0.2 dB in HSL (rotation around probe axis)<br>± 0.4 dB in HSL (rotation normal to probe axis)   |
| Dynamic range | 5 µW/g to >100 mW/g   |
| Dimensions    | Overall length: 330 mm<br>Tip length: 16 mm<br>Body diameter: 12 mm<br>Tip diameter: 6.8 mm<br>Distance from probe tip to dipole centers: 2.7 mm<br>Tip distance to phantom inner surface: 1.4 mm |
| Calibration   | Jan-03 (see Appendix C)   |
| Due date      | Jan-04  |

The E-field probe is connected to the robot arm as can be seen in Figure 3.2.1.

### 3.4 Device holder

Fig. 3.4.1. Device holder.

The holder was provided by SPEAG as a part of the DASY3 system.

### 3.5 Dipole antennas for validation

The dipole antenna is matched for use near flat phantoms filled with head/body simulation solutions. The dipole is equipped with 10 mm distance holders.

| Antenna         | Type    | Serial number | Calibration | Due date |
|-----------------|---------|---------------|-------------|----------|
| 1900 MHz dipole | D1900V2 | 5d013         | Jul-02      | Jul-04   |

### 3.6 Phantom

Fig. 3.6.1. SAM-phantom

The phantom enables dosimetric evaluation of left and right hand phone usage, as well as body mounted usage at the flat phantom region.

|                 |   |
|-----------------|---|
| Shell thickness | $2 \pm 0.2$ mm, except at Ear Reference Point, where an integrated spacer provides a 6 mm spacing from tissue simulating liquid |
| Liquid depth    | $15 \pm 0.5$ cm   |

### 3.7 Base Station Simulator

The phone was put into operation using Rhode & Schwarz digital radio testers, CMU 200. Communication between the phone and the testers was established by air links.

| Test Equipment | Digital radiocommunication Tester |            |
|----------------|-----------------------------------|------------|
| Model          | CMU 200                           |            |
| Serial number  | 101111                            | 838115/061 |
| Calibration    | Mar-02                            | Aug-02     |
| Due date       | Mar-03 *)                         | Aug-03     |

\*) New device. Will be calibrated 07/03.

### 3.8 Additional equipment needed in system check

| Test Equipment          | Model              | Serial Number | Calibration | Due Date |
|-------------------------|--------------------|---------------|-------------|----------|
| Signal Generator        | HP 8642B           | 2531A00362    | Apr-03      | Apr-04   |
| Amplifier               | Minicircuit ZHL-42 | N072095-5     | -           | N/A      |
| Power Meter             | R&S NRVS           | 838624/032    | Jul-02      | Jul-04   |
| Power Meter             | R&S NRVS           | 849305/028    | Jul-02      | Jul-04   |
| Power Sensor            | R&S NRV-Z32        | 825600/004    | Jul-02      | Jul-04   |
| Power Sensor            | R&S NRV-Z32        | 839176/020    | Jul/2002    | Jul-04   |
| Thermometer             | 175-H2             | 20004475/211  | Nov-02      | Nov-03   |
| Vector Network Analyzer | HP8753E            | US38432928    | Oct-02      | Oct-03   |
| Dielectric Probe Kit    | HP85070B           | US33020420    | -           | -        |

### 3.9 RF characteristics of the test site

Tests were performed in RF shielded environment.

## 4. TEST CONDITIONS

### 4.1 Ambient Conditions

|                          |            |            |
|--------------------------|------------|------------|
| Date                     | 2003-04-08 | 2003-04-09 |
| Ambient temperature (°C) | 22±1       | 22±1       |
| Humidity (% RH)          | 30-40      | 30-40      |

### 4.2 System Performance Check

Manufacturer calibrates the probes annually. Dielectric parameters of the simulating liquids are measured using a dielectric probe kit HP85070B and a vector network analyzer HP8753E.

The SAR measurements of the DUT were done within 24 hours of system performance check, which was done using the dipole validation kit.

The dipole antenna is matched to be used near flat section of the phantom filled with tissue simulating solution. Length of 1900 MHz dipole is 68 mm with overall height of 300 mm. A specific distance holder is used in the positioning of relevant antenna to ensure correct spacing between the phantom and the dipole. Manufacturer's reference dipole data (=calibration data) is presented in Appendix C.

Power level of 250 mW was supplied to a dipole antenna placed under the flat section of SAM phantom. The results are in the table below and printout of the test is presented in Appendix A. The references are the calibration results of the dipole antenna. The reference results of the liquid parameters are those used by Speag during dipole calibrations. The ±10%-limits for SAR values and the ±5%-limits for liquid parameters are calculated from the reference values.

| Tissue          | Measuring date   | SAR<br>(W/kg), 1g | Dielectric Parameters |                |
|-----------------|------------------|-------------------|-----------------------|----------------|
|                 |                  |                   | $\epsilon_r$          | $\sigma$ (S/m) |
| Head 1900 MHz   | Reference Result | 11.0              | 39.8                  | 1.46           |
|                 | Requirement      | 9.90 - 12.1       | 37.8 - 41.8           | 1.39 - 1.53    |
|                 | 2003-04-08       | 10.9              | 39.4                  | 1.46           |
| Muscle 1900 MHz | Reference Result | 10.6              | 51.0                  | 1.57           |
|                 | Requirement      | 9.54 - 11.7       | 48.5 - 53.6           | 1.49 - 1.65    |
|                 | 2003-04-09       | 9.68              | 52.3                  | 1.51           |

### 4.3 Tissue Simulants

#### 4.3.1 Measured values of liquid parameters

The tissue simulating liquids are measured by using a HP 85070B dielectric probe kit. The measured dielectric parameters are compared to the

recommended values for 835 MHz and for 1800-1900 MHz given in OET Bulletin 65, Supplement C, Edition 01-01.

| Tissue          | Measuring date       | Dielectric Parameters |           |
|-----------------|----------------------|-----------------------|-----------|
|                 |                      | $\epsilon_r$          | $\sigma$  |
| Head 1880 MHz   | Recommended          | 40.0                  | 1.40      |
|                 | Limits ( $\pm 5\%$ ) | 38.0-42.0             | 1.33-1.47 |

## 5. DEVICE POSITIONING

### 5.1 Positioning procedures

The mobile phone was measured in 2 positions on both “left hand” and “right hand” side of the phantom. Furthermore, the phone was measured in the carrying case under the flat section of the phantom.

#### 5.1.1 Cheek/Touch Position

- 1) The phone was positioned with the vertical centerline of the body of the phone and the horizontal line crossing the center of the earpiece in a plane parallel to the sagittal plane of the phantom (“initial position”). While maintaining the phone in this plane, the vertical centerline was aligned with the reference plane containing the three ear and mouth reference points (RE, LE and M) and the center of the earpiece was aligned with the line RE-LE.
- 2) The mobile phone was moved towards the phantom with the earpiece aligned with the line LE-RE until the phone touched the ear. While maintaining the phone contact with the ear, the bottom of the phone was moved until any point of the phone was in contact with a phantom point below the ear.

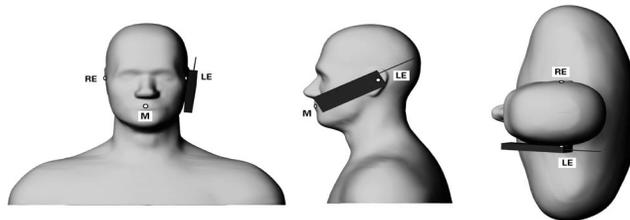

Fig. 5.1.1. Cheek/Touch position

#### 5.1.2 Ear/Tilted Position

- 1) The phone was positioned in the “cheek/touch” position as described above.
- 2) While the phone was maintained in the reference plane described above and pivoting against the ear, the phone was moved outward away from the mouth by an angle of 15 degrees or until contact with the ear was lost.

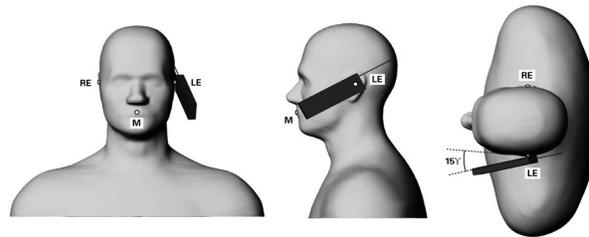

Fig. 5.1.2. Ear/Tilt Position.

### 5.1.3 Photos of setup

Fig. 5.1.3.1. Cheek position.

Fig. 5.1.3.2. Cheek position seen from backside of the phone. Polystyrene piece used as positioning support.

Fig. 5.1.3.3. Tilt position.

#### 5.1.4 Body Worn Configuration

The phone was positioned into the holder and placed below the flat section of the phantom. The distance between the phone and the phantom was kept at 15 mm during all measurements. Measurements were performed with the keyboard side towards the phantom.

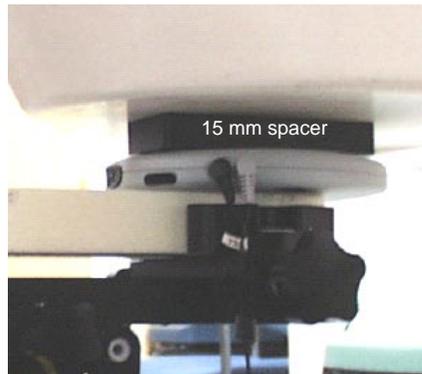

Fig. 5.1.4.1. PDNNEM-4 in body position with 15 mm spacer.

Fig.5.1.4.2. PDNNEM-4 in body position and spacer removed. Phone is on the polystyrene support and has stereo headset HDD-2 connected.

## 5.2 Scan Procedures

First coarse scan is used for quick determination of the field distribution. Next cube scan, 5x5x7 points; spacing between each point 8x8x5 mm, is performed around the highest E-field value to determine the averaged SAR-distribution over 1g.

## 5.3 SAR Averaging Methods

The maximum SAR value is averaged over its volume using interpolation and extrapolation.

The interpolation of the points is done with a 3d-Spline. The 3d-Spline is composed of three one-dimensional splines with the "Not a knot" -condition [W. Gander, Computermathematik, p. 141-150] (x, y and z -directions) [Numerical Recipes in C, Second Edition, p 123].

The extrapolation is based on least square algorithm [W. Gander, Computermathematik, p.168-180]. Through the points in the first 30 mm in all z-

---

axis, polynomials of order four are calculated. This polynomial is then used to evaluate the points between the surface and the probe tip. The points, calculated from the surface, have a distance of 1mm from one another.

**6. MEASUREMENT UNCERTAINTY**

**6.1 Table – Measurement uncertainty evaluation**

| <i>a</i>  | <i>b</i>         | <i>c</i>   | <i>d</i>    | $e = f(d,k)$ | <i>F</i>        | $h = c \times f / e$ | <i>k</i> |
|---|------------------|------------|-------------|--------------|-----------------|----------------------|----------|
| Uncertainty Component   | Section in P1528 | Tol. (± %) | Prob. Dist. | Div.         | $c_i$           | $u_i$ (±%)           | $v_i$    |

## 7. RESULTS

The SAR results shown in the tables are maximum SAR values averaged over 1g of tissue. The maximum result of every different test configuration is included in the appendix B as SAR distribution plots. The other SAR distribution plots are substantially similar or equivalent to the plots submitted regardless of used channel in each mode and position.

### 7.1 Head Configuration

With MMC-card

| Position             | GSM 1900        |         |         |          |

**7.2 Body configuration**

Body SAR measurements were performed with the headset HDD-2 or HDC-5 connected. Keyboard side of the phone was towards the phantom, because in this position the highest SAR values were achieved. The results with 15 mm separation distance are listed in the tables below.

| Accessory         | GSM 1900 + GPRS (2-slot TX) |         |         |          |

## 1. Measurement Conditions

The measurements were performed in the flat section of the new generic twin phantom filled with brain simulating sugar solution of the following electrical parameters at 1900 MHz:

|                       |                   |            |
|-----------------------|-------------------|------------|
| Relative permittivity | <b>39.8</b>       | $\pm 5\%$  |
| Conductivity          | <b>1.46 mho/m</b> | $\pm 10\%$ |

The DASY3 System (Software version 3.1d) with a dosimetric E-field probe ET3DV6 (SN:1507, conversion factor 5.2 at 1900 MHz) was used for the measurements.

The dipole feedpoint was positioned below the center marking and oriented parallel to the body axis (the long side of the phantom). The standard measuring distance was 10mm from dipole center to the solution surface. The included distance holder was used during measurements for accurate distance positioning.

The coarse grid with a grid spacing of 20mm was aligned with the dipole. The 5x5x7 fine cube was chosen for cube integration. Probe isotropy errors were cancelled by measuring the SAR with normal and 90° turned probe orientations and averaging. The dipole input power (forward power) was 250mW  $\pm 3\%$ . The results are normalized to 1W input power.

### 2.1. SAR Measurement with DASY3 System

Standard SAR-measurements were performed according to the measurement conditions described in section 1. The results (see figure supplied) have been normalized to a dipole input power of 1W (forward power). The resulting averaged SAR-values measured with the dosimetric probe ET3DV6 SN:1507 and applying the worst-case extrapolation are:

|  |                  |
|--|------------------|
| averaged over 1 cm <sup>3</sup> (1 g) of tissue:   | <b>44.0 mW/g</b> |
| averaged over 10 cm <sup>3</sup> (10 g) of tissue: | <b>22.8 mW/g</b> |

### 2.2. SAR Measurement with DASY4 System

Standard SAR-measurements were performed according to the measurement conditions described in section 1. The results (see figure supplied) have been normalized to a dipole input power of 1W (forward power). The resulting averaged SAR-values measured with the dosimetric probe ET3DV6 SN:1507 and applying the advanced extrapolation are:

|  |                  |
|--|------------------|
| averaged over 1 cm <sup>3</sup> (1 g) of tissue:   | <b>40.4 mW/g</b> |
| averaged over 10 cm <sup>3</sup> (10 g) of tissue: | <b>21.4 mW/g</b> |

### 3. Dipole Impedance and Return Loss

The impedance was measured at the SMA-connector with a network analyzer and numerically transformed to the dipole feedpoint. The transformation parameters from the SMA-connector to the dipole feedpoint are:

Electrical delay: **1,194 ns** (one direction)  
Transmission factor: **0,993** (voltage transmission, one direction)

The dipole was positioned at the flat phantom sections according to section 1 and the distance holder was in place during impedance measurements.

Feedpoint impedance at 1900 MHz:  $Re\{Z\} = 50,1 \Omega$   
 $Im\{Z\} = 3,0 \Omega$   
Return Loss at 1900 MHz: **-30,6 dB**

### 4. Handling

Do not apply excessive force to the dipole arms, because they might bend. Bending of the dipole arms stresses the soldered connections near the feedpoint leading to a damage of the dipole.

### 5. Design

The dipole is made of standard semirigid coaxial cable. The center conductor of the feeding line is directly connected to the second arm of the dipole. The antenna is therefore short-circuited for DC-signals.

Small end caps have been added to the dipole arms in order to improve matching when loaded according to the position as explained in Section 1. The SAR data are not affected by this change. The overall dipole length is still according to the Standard.

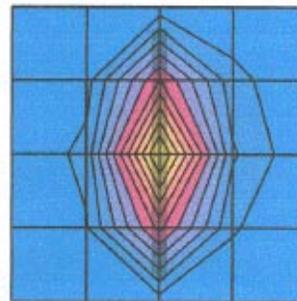

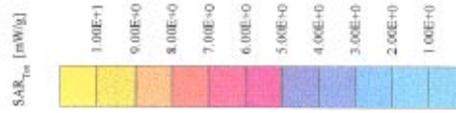

### 6. Power Test

After long term use with 40W radiated power, only a slight warming of the dipole near the feedpoint can be measured.

## Dipole Validation Kit

Type: D1900V2

Serial: 5d013

Manufactured: April 30, 2002  
Calibrated: January 9, 2003

## 1. Measurement Conditions

The measurements were performed in the flat section of the SAM twin phantom filled with body simulating glycol solution of the following electrical parameters at 1900 MHz:

|                        |                   |           |
|------------------------|-------------------|-----------|
| Relative Dielectricity | <b>51.0</b>       | $\pm 5\%$ |
| Conductivity           | <b>1.57 mho/m</b> | $\pm 5\%$ |

The DASY4 System with a dosimetric E-field probe ET3DV6 (SN:1507, Conversion factor 4.9 at 1900 MHz) was used for the measurements.

The dipole was mounted on the small tripod so that the dipole feedpoint was positioned below the center marking of the flat phantom section and the dipole was oriented parallel to the body axis (the long side of the phantom). The standard measuring distance was 10mm from dipole center to the solution surface. The included distance holder was used during measurements for accurate distance positioning.

The coarse grid with a grid spacing of 15mm was aligned with the dipole. The 7x7x7 fine cube was chosen for cube integration.

The dipole input power (forward power) was  $250\text{mW} \pm 3\%$ . The results are normalized to 1W input power.

## 2. SAR Measurement with DASY4 System

Standard SAR-measurements were performed according to the measurement conditions described in section 1. The results (see figure supplied) have been normalized to a dipole input power of 1W (forward power). The resulting averaged SAR-values measured with the dosimetric probe ET3DV6 SN:1507 and applying the advanced extrapolation are:

|  |                  |
|--|------------------|
| averaged over $1\text{ cm}^3$ (1 g) of tissue:   | <b>42.4 mW/g</b> |
| averaged over $10\text{ cm}^3$ (10 g) of tissue: | <b>21.7 mW/g</b> |

### 3. Dipole Impedance and Return Loss

The impedance was measured at the SMA-connector with a network analyzer and numerically transformed to the dipole feedpoint. The transformation parameters from the SMA-connector to the dipole feedpoint are:

Electrical delay: 1.193 ns (one direction)  
Transmission factor: 0.997 (voltage transmission, one direction)

The dipole was positioned at the flat phantom sections according to section I and the distance holder was in place during impedance measurements.

Feedpoint impedance at 1900 MHz:  $\text{Re}\{Z\} = 46,7 \Omega$   
 $\text{Im}\{Z\} = 2,8 \Omega$   
Return Loss at 1900 MHz: -26,9 dB

### 4. Handling

Do not apply excessive force to the dipole arms, because they might bend. Bending of the dipole arms stresses the soldered connections near the feedpoint leading to a damage of the dipole.

### 5. Design

The dipole is made of standard semirigid coaxial cable. The center conductor of the feeding line is directly connected to the second arm of the dipole. The antenna is therefore short-circuited for DC-signals.

Small end caps have been added to the dipole arms in order to improve matching when loaded according to the position as explained in Section I. The SAR data are not affected by this change. The overall dipole length is still according to the Standard.

### 6. Power Test

After long term use with 40W radiated power, only a slight warming of the dipole near the feedpoint can be measured.

Date/Time: 01/09/03 17:04:5

Test Laboratory: SPEAG, Zurich, Switzerland  
File Name: SN5d013\_SN1507\_M1900\_090103.das4

**DUT: Dipole 1900 MHz** Type & Serial Number: D1900V2 - SN5d013  
Program: Dipole Calibration; Pin = 250 mW; d = 10 mm

Communication System: CW-1900, Frequency: 1900 MHz; Duty Cycle: 1:1  
Medium: Muscle 1900 MHz ( $\sigma = 1.57$  mho/m,  $\epsilon = 50.97$ ,  $\rho = 1000$  kg/m<sup>3</sup>)  
Phantom section: FlatSection

**DASY4 Configuration:**

- Probe: ET3DV6 - SN1507; CorvF(4.9, 4.9, 4.9); Calibrated: 1/24/2002
- Sensor-Surface: 4mm (Mechanical Surface Detection)
- Electronics: DAE3 - SN410; Calibrated: 7/18/2002
- Phantom: SAM 4.0 - TP:1006
- Software: DASY4, V4.0 Build 51

**Area Scan (81x81x1):** Measurement grid: dx=15mm, dy=15mm  
**Zoom Scan (7x7x7)/Cube 0:** Measurement grid: dx=5mm, dy=5mm  
Reference Value = 91.7 V/m  
Peak SAR = 19.4 mW/g  
SAR(1 g) = 10.6 mW/g; SAR(10 g) = 5.44 mW/g  
Power Drift = -0.003 dB
