

**Environmental evaluation and exposure limit according to FCC CFR 47part 1,  
§1.1307, §1.1310**

The transceiver is classified as fixed, the calculation was done to check a safe distance.

Limit for power density for general population/uncontrolled exposure is  $1 \text{ mW/cm}^2$  for 1500 -100000 MHz frequency range.

The power density  $P \text{ (mW/cm}^2\text{)} = P_T / 4\pi r^2$ , where

$P_T$  is the transmitted power, which is equal to the peak transmitter output power plus maximum antenna gain. The maximum equivalent isotropically radiated power EIRP is

$$P_T = 23.98 \text{ dBm} + 20.5 \text{ dBi} = 44.48 \text{ dBm} = 28054 \text{ mW}, \text{ where}$$

23.98 dBm is the EUT maximum output power (per port),  
20.5 dBi – antenna gain.

The minimum safe distance “r”, where RF exposure does not exceed FCC permissible limit, is

$$r = \sqrt{P_T / (P \times 4\pi)} = \sqrt{28054 / 12.56} = 47.2 \approx 48 \text{ cm}.$$

A warning about a safe distance is contained in the user manual.
