

RF Exposure evaluation

FCC ID: 2ADH6-1909018B

According to 447498 D01 General RF Exposure Guidance v06 The 1-g and 10-g SAR test exclusion thresholds for 100 MHz to 6 GHz at test separation distances ≤ 50 mm are determined by:
[(max. power of channel, including tune-up tolerance, mW)/(min. test separation distance, mm)] $\cdot [\sqrt{f(\text{GHz})}] \leq 3.0$ for 1-g SAR and ≤ 7.5 for 10-g extremity SAR, where f(GHz) is the RF channel transmit frequency in GHz

Power and distance are rounded to the nearest mW and mm before calculation

The result is rounded to one decimal place for comparison For Bluetooth

BR/EDR

pt=4.90dBm=3.090mW at 2480MHz

So $(3.090\text{mW}/5\text{mm}) \times \sqrt{2.480\text{GHz}} = 0.97 < 3$

For Bluetooth Low Energy

pt=2.67dBm=1.849mW at 2480MHz

So $(1.849\text{mW}/5\text{mm}) \times \sqrt{2.480\text{GHz}} = 0.58 < 3$

Then SAR evaluation is not required
