6.3 Occupy Bandwidth

| | |
|-------------------|---|
| Test Requirement: | FCC part 22.917(b), FCC part 24.238(b) |
| Test Method: | ANSI/TIA-603-D 2010 |
| Test setup: |  <p>The diagram illustrates the test setup for measuring occupied bandwidth. A 'System simulator' (represented by a blue box with two ports) is connected to a 'Spectrum Analyzer' (also a blue box with one port). The connection between them is labeled 'Splitter' and 'ATT'. The output of the 'EUT' (Equipment Under Test, shown as a black rectangle) is also connected to the 'Spectrum Analyzer' through the same path.</p> |
| Test Procedure: | <ol style="list-style-type: none"> 1. The EUT's output RF connector was connected with a short cable to the spectrum analyzer 2. RBW was set to about 1% of emission BW, VBW= 3 times RBW. 3. -26dBc display line was placed on the screen (or 99% bandwidth), the occupied bandwidth is the delta frequency between the two points where the display line intersects the signal trace. |

6.6 Field strength of spurious radiation measurement

| | |
|-------------------|--|
| Test Requirement: | FCC part 22.917(a), FCC part 24.238(a) |
| Test Method: | ANSI/TIA-603-D 2010 |
| Limit: | -13dBm |
| Test setup: | <p>Below 1GHz</p> <p>Above 1GHz</p> |
| Test Procedure: | <ol style="list-style-type: none"> The EUT was placed on a non-conductive turntable using a non-conductive support. The radiated emission at the fundamental frequency was measured at 3 m with a test antenna and EMI spectrum analyzer. During the tests, the antenna height and the EUT azimuth were varied in order to identify the maximum level of emissions from the EUT. This maximization process was repeated with the EUT positioned in each of its three orthogonal orientations. The frequency range up to tenth harmonic was investigated for each of three fundamental frequency (low, middle and high channels). Once spurious emission was identified, the power of the emission was determined using the substitution method. The spurious emissions attenuation was calculated as the difference between radiated power at the fundamental frequency and the spurious emissions frequency. $\text{ERP / EIRP} = \text{S.G. output (dBm)} + \text{Antenna Gain(dB/dBi)} - \text{Cable Loss (dB)}$ |
