### Note:

In section 15.31(m), regards to the operating frequency range over 10 MHz, the Lowest frequency, the middle frequency, and the highest frequency of channel were selected to perform the test, and the selected channel see below:

| ~   | Channel             | Frequency |      |  |
|-----|---------------------|-----------|------|--|
| (3) | The Lowest channel  | 2402MHz   | (~~) |  |
|     | The Middle channel  | 2441MHz   |      |  |
|     | The Highest channel | 2480MHz   |      |  |
|     |                     |           |      |  |
|     |                     |           |      |  |

# **5** Test results and Measurement Data

### 5.1 Antenna Requirement

Standard requirement: 47 CFR Part 15C Section 15.203 /247(c)

### 15.203 requirement:

An intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device. The use of a permanently attached antenna or of an antenna that uses a unique coupling to the intentional radiator, the manufacturer may design the unit so that a broken antenna can be replaced by the user, but the use of a standard antenna jack or electrical connector is Prohibited.

### 15.247(b) (4) requirement:

The conducted output power limit specified in paragraph (b) of this section is based on the use of antennas with directional gains that do not exceed 6 dBi. Except as shown in paragraph (c) of this section, if transmitting antennas of directional gain greater than 6 dBi are used, the conducted output power from the intentional radiator shall be reduced below the stated values in paragraphs (b)(1), (b)(2), and (b)(3) of this section, as apPropriate, by the amount in dB that the directional gain of the antenna exceeds 6 dBi.

| EUT Antenna:               | Please see Internal photos                      |
|----------------------------|---|
| The antenna is Chip antenn | a. The best case gain of the antenna is 0.5dBi. |

### 5.2 AC Power Line Conducted Emissions

| 2  | Limit:                 | Frequency hopping systems operating in the 2400-2483.5 MHz band may have hopping channel carrier frequencies that are separated by 25 kHz or two-thirds of the 20 dB bandwidth of the hopping channel, whichever is greater.  |
|    | Exploratory Test Mode: | Hopping transmitting with all kind of modulation and all kind of data type  |
|    | Final Test Mode:       | Through Pre-scan, find the DH5 of data type is the worst case of GFSK modulation type, 2-DH5 of data type is the worst case of $\pi$ /4DQPSK modulation type, 3-DH5 of data type is the worst case of 8DPSK modulation type.  |
| 20 |                        | l spor  |

### 5.6 Number of Hopping Channel

| Test Requirement: | 47 CFR Part 15C Section 15.247 (a)(1)   |
|-------------------|---|
| Test Method:      | ANSI C63.10:2013  |
| Test Setup:       | Control<br>Control<br>Control<br>Power<br>Supply<br>Teble<br>Table<br>RF test<br>System<br>Instrument   |
|                   | Remark: Offset=Cable loss+ attenuation factor.  |
| Test Procedure:   | <ol> <li>The RF output of EUT was connected to the spectrum analyzer by RF cable and attenuator. The path loss was compensated to the results for each measurement.</li> <li>Set to the maximum power setting and enable the EUT transmi continuously.</li> <li>Enable the EUT hopping function.</li> </ol>   |
|                   | <ul> <li>4. Use the following spectrum analyzer settings: Span = the frequency band of operation; set the RBW to less than 30% of the channel spacing or the 20 dB bandwidth, whichever is smaller; VBW≥RBW; Sweep= auto Detector function = peak; Trace = max hold.</li> <li>5. The number of hopping frequency used is defined as the number of total channel.</li> </ul> |
|                   | 6. Record the measurement data in report.   |
| Limit:            | Frequency hopping systems in the 2400-2483.5 MHz band shall use a least 15 channels.  |
| Test Mode:        | Hopping transmitting with all kind of modulation  |
| Test Results:     | Refer to Appendix A   |
|                   |   |

### 5.7 Time of Occupancy

| Test Requirement: | 47 CFR Part 15C Section 15.247 (a)(1)  |
|-------------------|--|
| Test Method:      | ANSI C63.10:2013   |
| Test Setup:       | Control<br>Control<br>Control<br>Power<br>Supply<br>Temperature CABNET<br>Table  |
|                   | Remark: Offset=Cable loss+ attenuation factor.   |
| Test Procedure:   | <ol> <li>The RF output of EUT was connected to the spectrum analyzer by RF cable and attenuator. The path loss was compensated to the results for each measurement.</li> <li>Set to the maximum power setting and enable the EUT transmit continuously.</li> <li>Enable the EUT hopping function.</li> <li>Use the following spectrum analyzer settings: Span = zero span, centered on a hopping channel; RBW shall be ≤ channel spacing and where possible RBW should be set &gt;&gt; 1 / T, where T is the expected dwell time per channel; VBW≥RBW; Sweep = as necessary to capture the entire dwell time per hopping channel; Detector function = peak; Trace = max hold.</li> <li>Measure and record the results in the test report.</li> </ol> |
| Limit:            | The average time of occupancy on any channel shall not be greater than 0.4 seconds within a period of 0.4 seconds multiplied by the number of hopping channels employed.   |
| Test Mode:        | Hopping transmitting with all kind of modulation and all kind of data type.  |
| Test Results:     | Refer to Appendix A  |

### 5.8 Band edge Measurements

|      | Test Requirement:      | 47 CFR Part 15C Section 15.247 (d)  |
|------|------------------------|---|
|      | Test Method:           | ANSI C63.10:2013  |
| (CN) | Test Setup:            | Control<br>Control<br>Control<br>Control<br>Control<br>Control<br>Control<br>Control<br>Power<br>port<br>Power<br>port<br>Power<br>port<br>Power<br>TeMPERATURE CABRIET<br>Table  |
|      |                        | Remark: Offset=Cable loss+ attenuation factor.  |
| (CN) | Test Procedure:        | <ol> <li>Set to the maximum power setting and enable the EUT transmit continuously.</li> <li>Set RBW = 100 kHz, VBW = 300 kHz (≥RBW). Band edge emissions must be at least 20 dB down from the highest emission level within the authorized band as measured with a 100kHz RBW. The attenuation shall be 30 dB instead of 20 dB when RMS conducted output power Procedure is used.</li> <li>Enable hopping function of the EUT and then repeat step 2 and 3.</li> <li>Measure and record the results in the test report.</li> </ol> |
| X    | Limit:                 | In any 100 kHz bandwidth outside the frequency band in which the spread spectrum intentional radiator is operating, the radio frequency power that is Produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement.   |
| 6    | Exploratory Test Mode: | Hopping and Non-hopping transmitting with all kind of modulation and all kind of data type  |
|      | Final Test Mode:       | Through Pre-scan, find the DH5 of data type is the worst case of GFSK modulation type, 2-DH5 of data type is the worst case of $\pi$ /4DQPSK modulation type, 3-DH5 of data type is the worst case of 8DPSK modulation type.  |
|      | Test Results:          | Refer to Appendix A   |

#### 5.9 **Conducted Spurious Emissions**

| Test Requirement:      | 47 CFR Part 15C Section 15.247 (d)   |
|------------------------|--|
| Test Method:           | ANSI C63.10:2013   |

|                        | Remark: Offset=Cable loss+ attenuation factor.   |
| Test Procedure:        | <ol> <li>The RF output of EUT was connected to the spectrum analyzer by RF cable and attenuator. The path loss was compensated to the results for each measurement.</li> <li>Set to the maximum power setting and enable the EUT transmit continuously.</li> <li>Set RBW = 100 kHz, VBW = 300kHz, scan up through 10th harmonic. All harmonics / spurs must be at least 20 dB down from the highest emission level within the authorized band as measured with a 100kHz RBW.</li> <li>Measure and record the results in the test report.</li> <li>The RF fundamental frequency should be excluded against the limit line in the operating frequency band.</li> </ol> |
| Limit:                 | In any 100 kHz bandwidth outside the frequency band in which the spread spectrum intentional radiator is operating, the radio frequency power that is Produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement.  |
| Exploratory Test Mode: | Non-hopping transmitting with all kind of modulation and all kind of data type   |
| Final Test Mode:       | Through Pre-scan, find the DH5 of data type is the worst case of GFSK modulation type, 2-DH5 of data type is the worst case of $\pi$ /4DQPSK modulation type, 3-DH5 of data type is the worst case of 8DPSK modulation type.   |
|                        | Refer to Appendix A  |

### 5.10 Pseudorandom Frequency Hopping Sequence

#### **Test Requirement:**

### 47 CFR Part 15C Section 15.247 (a)(1), (h) requirement:

The system shall hop to channel frequencies that are selected at the system hopping rate from a Pseudorandom ordered list of hopping frequencies. Each frequency must be used equally on the average by each transmitter. The system receivers shall have input bandwidths that match the hopping channel bandwidths of their corresponding transmitters and shall shift frequencies in synchronization with the transmitted signals.

Frequency hopping spread spectrum systems are not required to employ all available hopping channels during each transmission. However, the system, consisting of both the transmitter and the receiver, must be designed to comply with all of the regulations in this section should the transmitter be presented with a continuous data (or information) stream. In addition, a system employing short transmission bursts must comply with the definition of a frequency hopping system and must distribute its transmissions over the minimum number of hopping channels specified in this section.

The incorporation of intelligence within a frequency hopping spread spectrum system that permits the system to recognize other users within the spectrum band so that it individually and independently chooses and adapts its hopsets to avoid hopping on occupied channels is permitted. The coordination of frequency hopping systems in any other manner for the express purpose of avoiding the simultaneous occupancy of individual hopping frequencies by multiple transmitters is not permitted.

#### Compliance for section 15.247(a)(1)

According to Bluetooth Core Specification, the pseudorandom sequence may be generated in a ninestage shift register whose 5th and 9th stage

outputs are added in a modulo-two addition stage. And the result is fed back to the input of the first stage. The sequence begins with the first ONE of 9 consecutive ONEs; i.e. the shift register is initialized with nine ones.

- Number of shift register stages: 9
- Length of pseudo-random sequence: 2<sup>9</sup> -1 = 511 bits
- · Longest sequence of zeros: 8 (non-inverted signal)

Linear Feedback Shift Register for Generation of the PRBS sequence

An example of Pseudorandom Frequency Hopping Sequence as follow:

Each frequency used equally on the average by each transmitter.

According to Bluetooth Core Specification, Bluetooth receivers are designed to have input and IF bandwidths that match the hopping channel bandwidths of any Bluetooth transmitters and shift frequencies in synchronization with the transmitted signals.

### Compliance for section 15.247(g)

According to Bluetooth Core Specification, the Bluetooth system transmits the packet with the pseudorandom hopping frequency with a continuous data and the short burst transmission from the Bluetooth system is also transmitted under the frequency hopping system with the pseudorandom hopping frequency system.

#### Compliance for section 15.247(h)

According to Bluetooth Core specification, the Bluetooth system incorporates with an adaptive system to detect other user within the spectrum band so that it individually and independently to avoid hopping on the occupied channels.

According to the Bluetooth Core specification, the Bluetooth system is designed not have the ability to coordinated with other FHSS System in an effort to avoid the simultaneous occupancy of individual hopping frequencies by multiple transmitter.

## 5.11 Radiated Spurious Emission & Restricted bands

|   | Test Requirement: | 47 CFR Part 15C Section   | on 15.209 and 15                     | .205                      | 6            | •)                         |

### **Radiated Spurious Emission below 1GHz:**

During the test, the Radiates Emission from 30MHz to 1GHz was performed in all modes, only the worst case lowest channel of DH5 for GFSK was recorded in the report.

#### Remark:

1) The field strength is calculated by adding the Antenna Factor, Cable Factor & Preamplifier. The basic equation with a sample calculation is as follows:

Final Test Level = Receiver Reading + Antenna Factor + Cable Factor – Preamplifier Factor

2) Scan from 9kHz to 25GHz, the disturbance above 10GHz and below 30MHz was very low. As shown in this section, for frequencies above 1GHz, the field strength limits are based on average limits. However, the peak field strength of any emission shall not exceed the maximum permitted average limits specified above by more than 20 dB under any condition of modulation. So, only the peak measurements were shown in the report.

### Test plot as follows:

| Mode:   | GFSK Transmitting | Channel: | 2402 | 1    |

# Note:

The field strength is calculated by adding the Antenna Factor, Cable Factor & Preamplifier. The basic equation with a sample calculation is as follows:

Final Test Level =Receiver Reading - Correct Factor

Correct Factor = Preamplifier Factor-Antenna Factor-Cable Factor

## 6 Appendix A

Refer to Appendix: Bluetooth Classic of EED32O80133702
