Product Descriptions(Application/Features/Specification)

The EUT is a RF Keyboard. A major technical descriptions of EUT is described as following:

A. Operation Frequency	CH1:26.995 and CH2:27.195MHz
B. Modulation Type	FSK
C. Antenna Designation	Integral
D. Number Of Channel	2
E. Channel Spacing	100 KHz
F. Output Power	-34.74dBm
G.Operation Methodology	The EUT encoder generates a pulse code serially transmit
	(typical designation) into the modulator(or called as mixer) stage
	in circuit. This pulse signal mixed with the carrier at
	modulator(mixer) stage by way of FSK mode frequency
	modulation. The modulation depth is designed such as \pm 5KHz
	in this application, that means the pulse(may be at high level
	state or low level state) will trigger the oscillator to generate a
	frequency at a specified fundamental frequency +5KHz or
	-5KHz, depended on the designation. For example, if the carrier
	frequency defined as fundamental frequency +5KHz at high level
	state, then the alternative carrier frequency will be fundamental
	frequency –5KHz at low level state.

Based on the application, features, or specification exhibited in User's Manual, the EUT is considered as an ITE/Computing Device. More details of EUT technical specification, please refer to the User's Manual (Attachment - E.)
