

Comments and Response:

- 2) Please explain how the device is limited to use Band 13 only, keeping in mind software issues raised by KDB 594280.

Reply: Response is addressed in uploaded document, "LTE Band 13 Only Programming".

- 1) Kindly note the response to previous comment 2 regarding KDB 594280 mentions only the grantee may perform OTA programming. Please note per the KDB that if such programming is possible, details on the procedures to maintain control of the software uploads must be included in the application. Additionally note that this may also require ACB to submit a PAG to the FCC as required by KDB 388624, section C)2)d).

Reply: Additional clarification on this item. No change to the module software has been implemented in any way nor has the software been modified from the original submittal. The "Grantee" in this case has used the existing module software already embedded in the SARA-R410M module. What has been done is instead of allowing all channels to be used they send a command code to limit the module to only use LTE Band 13. This software coding is part of the original modular submittal from u-Blox.
