According to FCC CFR 47 § 1.1310: The criteria listed in the following table shall be used to evaluate the environment impact of human exposure to radio frequency (RF) radiation as specified in § 1.1307(b), except in the case of portable devices which shall be evaluated according to the provisions of FCC part 2.1093 of this chapter.

**TABLE 1 TO § 1.1310(E)(1)—LIMITS FOR MAXIMUM PERMISSIBLE EXPOSURE (MPE)**

Note 2: General population/uncontrolled exposure limits apply in situations in which the general public may be exposed, or in which persons who are exposed as a consequence of their employment may not be fully aware of the potential for exposure or cannot exercise control over their exposure.

### 5.3 Test Setup Diagram

#### For Mobile Exposure Conditions:

#### For Portable Exposure Conditions:

- 1) The RF exposure test was performed in anechoic chamber.
- 2) The distance of the points (A, B, C, D, E, F) is 0,2,4,6,8,10,12,14,16,18,20cm.
- 3) The values tested by the probe are X, Y and Z on three axes perpendicular to the edge of the device. Top and bottom side coincident with the axis (Y) of the main coil.

Note: The EHP-200A Probe has a diameter of 10.9cm and a radius of 5.45cm.

## 5.4 Measurement Procedure

### For Portable Exposure Conditions:

- 1) The portable test modes have covered the considerations of the mobile test, only record the test data of the portable conditions in this report.
- 2) Operating modes with client device (1%, 50%, 99% battery status of client device), have been tested, only show the data of worst case of 1% battery status of client device.
- 3) Test performed with all the radiating structures operating at maximum power at the same time.
- 4) E-field and H-field measurements are taken along all three axes the device from 0cm to 20cm in 2cm minimum increment for each edge surface of the host/client pair. If the center of the probe sensing elements is more than 5mm from the probe outer edge, the field strengths need to be estimated for the positions that are not reachable.
- 5) Validation of Field Estimates
  - a) If R is the probe radius and the probe tip is in contact with the coil, then the probe center is R cm from the coil surface as bellow picture:

- b) The probe then is measuring the field correctly at R cm from the surface, and only estimating the field at the 0 cm point of contact with the coil surface.
- c) The validation requires showing that the model used to estimate the field provides data within 30% accuracy for at least the two, 2-cm-spaced closest points to where the estimates were made.
- d) If there is only on estimated value, then a single validation point is sufficient.
- e) Validation Example for 4 cm Probe Radius as following

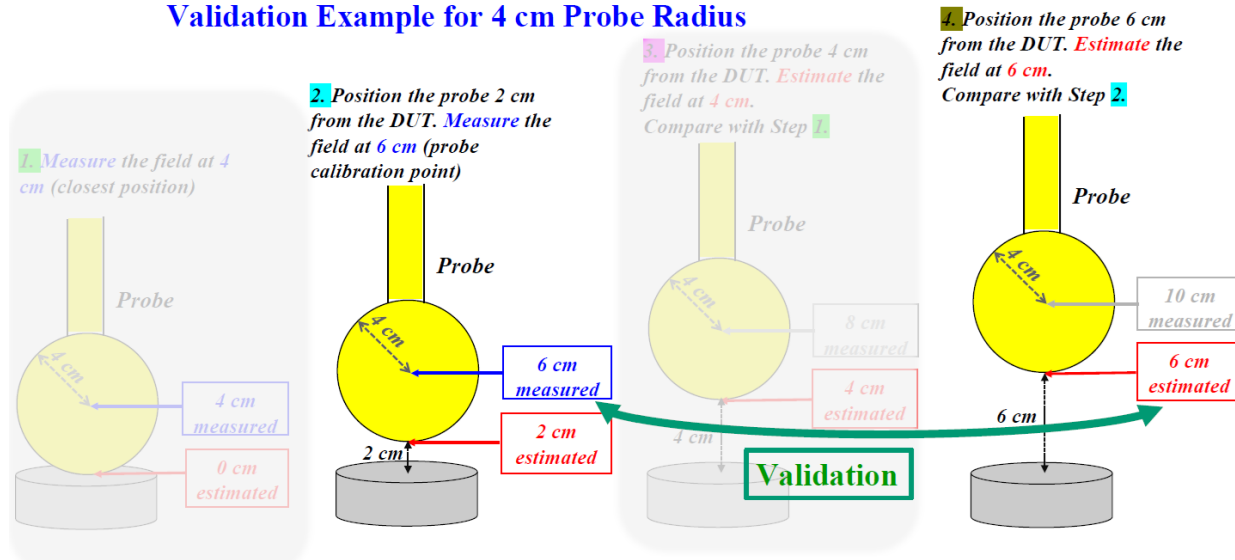

Step 1:

### Validation Example for 4 cm Probe Radius

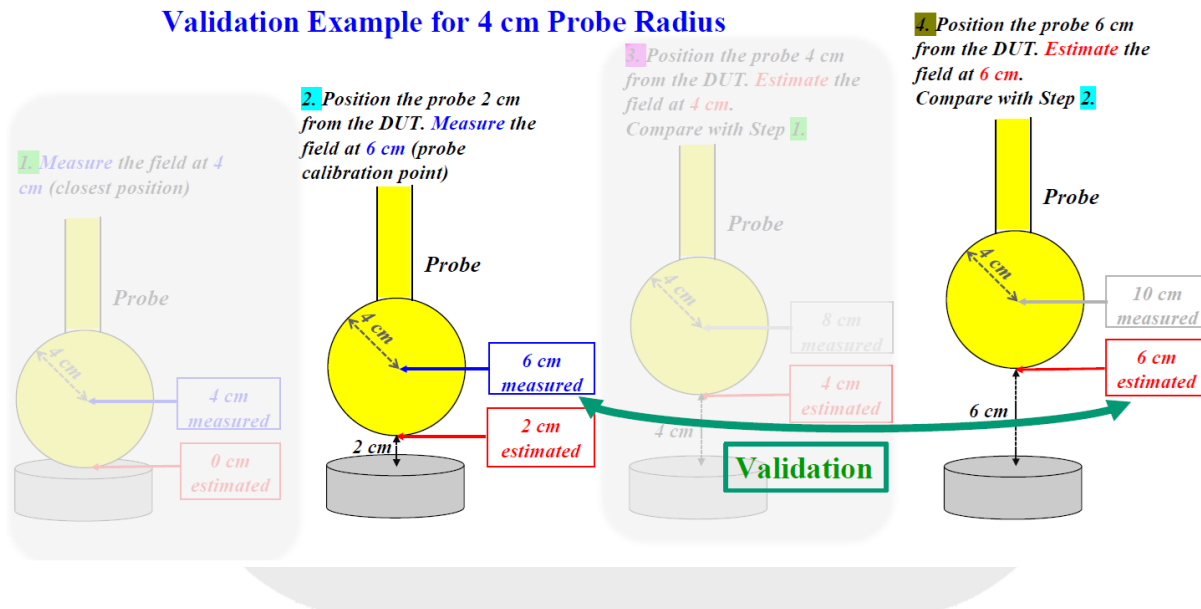

Step 2:

### Validation Example for 4 cm Probe Radius

Step 3:

### Validation Example for 4 cm Probe Radius

#### Description of the Validation Example for 4 cm Probe Radius

- Assume that  $R=4$  cm. The field at 0 cm can only be estimated, but the field at 4 cm is measured exactly (at the center of the probe)
- Move the probe at 2 cm from the surface. The field at 2 cm can still only be estimated, but the field at 6 cm is measured exactly.
- Compare the estimate with the values at the same positions where the field was measured exactly (i.e. 4 cm and 6 cm)
- The difference between measurements and estimates needs to be no more than 30%.
- The validation of the estimates needs to be for the two closest points to the coil, but at least 2 cm apart (in this case they are). This is to avoid a validation at, say 2 cm and another on at 2.1 cm, that is essentially a repetition.

6) According to Calibration information and specification about EHP-200A Probe, the probe's sensitive elements center are 8mm below the external surface, and the dimensions is 92\*92\*109mm, so the actual 0cm field strengths need to be estimated for the positions that are not reachable, only the result of test distance 2cm~20cm was measured value. The Extrapolated Value Calculation Method is described below.

	Length (mm)	Width (mm)	Height (mm)
	109	92	92

The sensitive elements are located approximately 8 mm below the external surface

Estimated method for portable RF Exposure condition:

We use Biot-Savart formula theory to estimate the strength of the magnetic field that the measuring instrument cannot measure. According to Biot-Savart formula:

Top & Bottom Side:

$$B = \frac{\mu_0 * I * N * R^2}{2 * (R^2 + x^2)^{3/2}}$$

Front, left, right & rear Side:

$$B = \frac{\mu_0 * I * N}{2 * x}$$

Where:

B: means H-field value.

$\mu_0$ : space permeability;  $\mu_0 = 4\pi * 10^{-7}$ :

I: A current element passing through a coil;

R: means the Radius of coil;

Test Distance: The distance from the sensing element of the probe to the edge of the device surface

x: means the center of the coil to the sensing elements of the probe. (For top & bottom side:  $x$ =test distance.

For other side:  $x$ =test distance +R)

N: Number of turns.

The conditions of EUT:

N=20

**For validation purposes:**

If the value to show a **30% agreement** between the model and the (E-and/or H-Field) probe measurements for the two closest points to the device surface, and with 2cm increments. Then this extrapolation method is reasonable.
