	8 7 6 5	4 3 2
	NOTES (CONTINUED FROM SHEET 1): 18. MODEM MANAGER (MODMAN)	<pre>20. KA-BAND AIRCRAFT NETWORKING DATA UNIT (KANDU)(CONTINUED) (C) KANDU RECEPTACLE A3J3 IS MIL-DTL-38999/20FG35PN, SERIES III, FLANGE MOUN' NORMAL KEYING, WITH 79 PIN-TYPE CONTACTS OF SIZE 22 AWG.</pre>
D	 (A) LRU TO BE MOUNTED ONLY IN AN ARINC 600 TRAY WITH MATCHING CONNECTOR SCHEME. (B) THE MODMAN USES A STANDARD ARINC SPECIFICATION 600, SIZE 2 CONNECTOR. MATES WITH RADIALL NSXN2B875S00 OR EQUIVALENT. THIS SINGLE RECEPTACLE INCLUDES THREE SEPARATE INSERTS (MODMAN A1J1-A, MODMAN A1J1-B, AND MODMAN / (i) MODMAN A1J1-A : ARRANGEMENT 011, SHELL SIZE 2 (11X SIZE 8 QUADRAX CAVITIES)CONNECTOR. (ii) MODMAN A1J1-B : ARRANGEMENT 120Q2, SHELL SIZE 2 (118X #22 CONTACTS, 2 SIZE 8 QUADRAX CAVITIE CONNECTOR. (iii) MODMAN A1J1-C : ARRANGEMENT 12F5C2, SHELL SIZE 2 (4X #12 CONTACTS, 1X #16 CONTACT, 5X SIZE OPTICAL CAVITIES, 2X SIZE 5 COAX CAVITIES). OPTICAL INTERFACES ARE NOT USED. 	 MATES WITH D38999/26FG35SN FOR CONTROL INTERFACE. (D) KANDU RECEPTACLE A4J4 IS TVPOORGQF-21-75P (AMPHENOL)/ EQUIVALENT. MATES W OR EQUIVALENT FOR ETHERNET INTERFACE. A1J1-C). (E) MAXIMUM ROUND TRIP WIRING INTERCONNECTION RESISTANCE BETWEEN KANDU A3J2 A EXCEED 0.326 Ω (CONSIDERING 16 AWG WIRE). FOR ANTENNA POWER DURING NORM. STEADY STATE POWER CONSUMPTION DURING NORMAL FMA ANTENNA OPERATION IS 135
	 (C) MODMAN BONDING IS THROUGH CONTACT WITH THE BASE OF THE UNIT. (D) DC BONDING RESISTANCE SHOULD NOT EXCEED 2.5 mΩ. (E) MODMAN A1J1 CONNECTOR CONTACT ASSIGNMENTS SHOWN ON SHEET 7. (F) MODMAN KEYING IS AS SHOWN BELOW. 	 (G) KANDU CONNECTOR CONTACT ASSIGNMENTS SHOWN IN TABLES 2, 3, 4 AND 5 (SHEET 21. KA-BAND RADIO FREQUENCY UNIT (KRFU) (A) KRFU RECEPTACLE A4J1 IS MIL-DTL-38999/20FC4PN, SERIES III, FLANGE MOUNT FNORMAL KEYING, WITH 4 PIN-TYPE CONTACTS OF SIZE 16 AWG. MATES WITH D38999/26FC4SN FOR POWER INPUT.
С	Idef area and/cates the anyonic Idef area anyonic I	 (B) KRFU RECEPTACLE A4J2 IS MIL-DTL-38999/20FC35PN, SERIES III, FLANGE MOUNT NORMAL KEYING, WITH 22 PIN-TYPE CONTACTS OF SIZE 22 AWG. MATES WITH D38999/26FC35SN FOR CONTROL INTERFACE. (C) KRFU RECEPTACLE A4J3 IS WR28 WAVEGUIDE P/N M3922/54-003. MATES WITH M3922/59-005 THROUGH HOLE FLANGE TYPE WR-28 WAVEGUIDE FLANGE F [0.112-40 UNC-28] FOR RF TX INTERFACE. P/N 90403751 WITH 0 RING P/N MS25 SEMI-RIGID, FLEXIBLE WAVEGUIDE COMPONENTS AND RF PLUMBING DETAILS.
	 (G) PODD ETHERNET PA1, PODD ETHERNET PA2, PODD ETHERNET PA3 AND PODD ETHERNET PA4 ARE DEFINED AS PER ARINC 791 PART 1 ALTERNATE CONFIGURATION. 19. FOR TX-IF AND RX-IF COAXIAL CABLE ASSEMBLY BETWEEN MODMAN A1J1-C AND THE KRFU A4J5 & A4J6 : (A) STRAIN RELIEF HEAT SHRINK SLEEVING OF LENGTH 0.5*±0.05* SHOULD BE PROVIDED TO PREVENT STRESS 	RECOMMEND TO USE WR28 TO WR34 WAVEGUIDE TRANSITION ADAPTOR AT KRFU J3 ENU (D) KRFU RECEPTACLE A4J4 IS WR42 WAVEGUIDE, M3922/54-001. MATES WITH M3922/59-003 THROUGH HOLE FLANGE TYPE WR42 WAVEGUIDE FLANGE PI [0.112-40 UNC-2B] FOR RF RX INTERFACE.
	 CONCENTRATION AT TX-IF AND RX-IF CABLE TERMINATIONS. (B) OVERBRAID/SLEEVE JACKETING SHOULD BE USED FOR PROTECTION OF WIRING BETWEEN BULKHEAD INTERFACE A6J33 AND A6J4B AND KRFU A4J5/A4J6. OVERBRAID MAY BE CONNECTED VIA CONNECTOR SHIELD/HOUSING OR DIRECTLY TO HOUSING. 	
В	(C) COAXIAL CABLE WITH FOLLOWING SPECIFICATIONS RECOMMENDED FOR TX-IF AND RX-IF INTERCONNECTION BETWEEN MODMAN AND KRFU. (i) THE MINIMUM CABLE INSERTION LOSS SHOULD BE 11 dB AT 950 MHz. (ii) THE MAXIMUM CABLE INSERTION LOSS SHOULD NOT EXCEED 18 dB AT 1450 MHz AND 21.2 dB AT 1950 MHz. (iii) THE MAXIMUM CABLE INSERTION LOSS SHOULD NOT EXCEED 18 dB AT 1450 MHz AND 21.2 dB AT 1950 MHz. (iii) THE NOMINAL CHARACTERISTIC IMPEDANCE : 50 Ω ± 2 Ω AT IF (950-1950 MHz) AND REFERENCE (50 MHz) FREQUENCIES. (iv) MAXIMUM VOLTAGE STANDING WAVE RATIO (VSWR), AS MEASURED AGAINST 50 OHMS : 1.5:1 FROM 10 MHz TO	MATES WITH TNC MALE PER MIL-C-87104/2 FOR RX-IF INTERFACE (LABELED GREEN) (H) STRAIN RELIEF HEAT SHRINK SLEEVING OF LENGTH 0.5°±0.05° SHOULD BE PROVID AT COAX CABLE TERMINATIONS. RECOMMEND TO USE BLUE COLOR CABLE SHRINK FOR CABLE SHRINK FOR THE RX-IF COAX CABLE.
	(v) THE ISOLATION BETWEEN THE TX-IF CABLÈ AND THE RX-IF CABLE SHOULD BE A MINIMUM OF 120 dB AT 215 (vi) POWER HANDLING CAPABILITY : +5 dBM AT IF AND REFERENCE FREQUENCY RANGE (950-1950 MHz). (vii) CABLE RUN ATTENUATION AT 50 MHz SHOULD NOT EXCEED 4 dB. (viii) THE VARIATION IN CABLE LOSS BETWEEN TX-IF AND RX-IF COAX CABLES SHOULD NOT EXCEED 1 dB AT 1450 (D) TX-IF CABLE SHOULD BE BLUE BANDED NEAR TNC∕N TYPE CONNECTOR ENDS.	50 MHz. (i) THE FREQUENCY RANGE OF OPERATION : 19.2 GHz TO 21.2 GHz. (ii) THE NOMINAL CHARACTERISTIC IMPEDANCE : 50 Ω.
	 RX-IF CABLE SHOULD BE GREEN BANDED NEAR TNC CONNECTOR ENDS. (E) RECOMMENDED TO USE 10.5 dB EQUALIZER IN TX-IF COAX CABLE INTERCONNECT AND 10.5 dB ATTENUATOR IN RX-CABLE INTERCONNECT BETWEEN MODMAN A1J1-C AND KRFU WIRE HARNESS INTERFACE IF THE COAX INTERCONNECT INTERCONNECT INTERCONNECT IS DETWEEN MODMAN AND KRFU IS LESS THAN 6.5 dB AT 950 MHz. EQUALIZER MINICIRCUITS P/N TAT-10R5DC-1 AND ATTENUATOR MINICIRCUITS P/N TAT-10R5-1+ OR EQUIVALENT. 	LOSS (L) THE RECEIVE PATH INTERCONNECT LOSSES BETWEEN THE OAE-FMA AND KRFU SHOULD
	20. SYSTEM DESCRIPTION AND INSTALLATION MANUAL JetWave™ System

JETWAVE™ AES SYSTEM CONFIGURATION

1. Provisioning of User Services

Within the JetWaveTM system, the Modman LRU is responsible for bringing Inmarsat satellite network IP access to onboard users through In-flight Entertainment Systems or through Onboard Network Systems. The Modman LRU coordinates with the Inmarsat Satellite Access Station (SAS) for modulation, demodulation, power control, terminal authentication, configuration, IP communication, QoS aspects and initiating tracking and beam switching for JetWaveTM system.

The commencement of RF transmission and reception of JetWaveTM system during normal operation is as follows:

- Satellite Search: The JetWaveTM system is looking for the correct satellite. In this state, the JetWaveTM system does not transmit.
- Global Signaling Channel: The JetWaveTM system is in this state when it successfully locks to the GSC signal. The Global Signaling Channel is used by the Inmarsat GX network to inform the JetWaveTM system terminal of the current satellite configurations and location. Inmarsat satellite generates a global beam which illuminates the entire service region in the satellite's footprint. Global Signaling Channel makes the frequencies and locations of each spot beam known to the JetWaveTM system and allows automatic network configuration and rapid network log-in.
- Data Communication: The JetWaveTM system is logged into the network, and is sending and receiving data. In the data communication state, the JetWaveTM system may be switched from one data carrier to another. This can occur for either load balancing reasons, or because of the JetWaveTM system moved into a different spot beam. During this transition, the JetWaveTM system continues transmitting normally. At some point, depending on the aircraft movements, directed satellite handover is used when the JetWaveTM system needs to switch between the satellites. The antenna re-pointing is required. The frequency band of the transmissions shifts and the KANDU will track on the new carrier. During this satellite transition, there will be a momentary disruption to the IP data connectivity.

Inmarsat GX Aviation services operate as a managed subscription service model and the services are provisioned through various Value Added Resellers / Distribution partners. To provision the user services, the Airline Operator need to associate the JetWaveTM system with any of the Value Added Resellers or Distribution Partners and subscribe to the desired Service Subscription Package services. The following is the current list of Value Added Resellers for AT&R market and Distribution Partners for BGA market:

- <u>NOTE:</u> The list of Value Added Resellers and Distribution Partners is correct at the time of publishing but may change.
 - Value Added Resellers:
 - OnAir
 - GoGo

Page 3-1 16 Sep 2015

SYSTEM DESCRIPTION AND INSTALLATION MANUAL

JetWave[™] System

- ARINC
- MCN (for the China market)
- INMARSAT (for Lufthansa, Germanwings, Swiss, Austrian, and Eurowings)
- Distribution Partners:
 - Satcom1
 - Satcom Direct
 - SITA OnAir
 - Gogo Business Aviation
 - ARINC Direct

The actual throughputs achieved by the GXA terminal are dependent on the Airline Operator subscription. Each subscription will have a defined Committed Information Rate which is the minimum throughput guaranteed to each subscriber. The delivered services will be able to exceed those CIRs where the resources allow up to maximum spot beam capacity. All instantaneous demand will be matched to provisioned CIRs for every priority level before any remaining bandwidth is allocated to satisfy any provisioned Maximum Information Rates.

The user connectivity is provided by the Modman LRU of the JetWaveTM system. The Modman traffic ports to which these user devices gets connected is configurable through the ground based NMS of the Value Added Resellers / Distribution Partners of Inmarsat GX network. This over the air configuration functionality supports the ARINC 791 domain segregation and other VAR/ DP requirements. In addition, the VAR /DPs may also gather statistics on the user domain ports of the JetWaveTM system for reporting at their NMS.

On initial power-up of the system, after uploading the JetWaveTM system configuration files and entering the aircraft tail no, the JetWaveTM system first gets associated to the Inmarsat test network. On the next power up the system is associated to the appropriate VAR / DP network, where the Service Level Agreements, the aircraft tail no and the pre-assigned JetWaveTM system terminal ids are linked for billing and service.

2. About Installation and Registration

The JetWave[™] subsystem LRUs that follow support registration of hardware targets with the FIND protocol in accordance with the A615A data load protocol:

- (1) Modman
- (2) KANDU
- (3) OAE- either FMA or TMA.

3. Product Support Services

A. Customer Support Overview

Page 3-2 16 Sep 2015

SYSTEM DESCRIPTION AND INSTALLATION MANUAL

JetWave[™] System

The JetWave[™] system is manufactured by Honeywell as sole supplier of Inmarsat GX Aviation equipment. Honeywell manufactures and sells this hardware to end customers, as well as to VARs and DPs.

B. Customer Support Contacts:

If you purchased your JetWave[™] hardware from any of the Inmarsat GX Aviation VARs/DPs, please contact their customer support phone number for all JetWave[™] installation, integration, configuration, service activation, and troubleshooting issues.

If however, you purchased your JetWave[™] hardware directly from Honeywell, please contact Honeywell Customer Support according to the information provided at the time of your JetWave[™] system activation.

4. AES Configuration Data

NOTE: Any tools for preparing the config files for the terminal must be licensed from Honeywell.

The AES configuration data is a set of configuration files, stored on the APM. Each configuration file contains a set of airplane-unique parameters. The parameters define the configuration of the AES necessary for the initialization and operation of the Honeywell JetWave[™] AES system. The AES configuration data holds information such as:

- Aircraft registration number
- Aircraft blockage information
- ARINC 429 label set for positioning and steering used by the KANDU
- WOW input and polarity etc
- USER operational preferences.

The details of ARINC 429 lables required for the JetWave™ System are mentioned in the table below.

	Required			Maximum Transmit	Maximum Transmit	•
Label Set	ARINC 429 Labels	Description	Source	Delay (M Sec)	Interval (Msec)	Approximate Resolution
Primary Label	For best accuracy	Preferred Label Set	Source		(W3CC)	Nesolution
150	Yes	UTC Time			1000	1 sec

A. Aircraft ID

This section describes the AES System configuration setting to be carried out on completion of LRU installation activities for updating the aircraft tail number.

Aircraft tail number is the unique identifier used by the Inmarsat system to identify the user aircraft within the network. The aircraft ID file contains aircraft identity information as follows (columns are Item, LRU, Data):

To update the aircraft tail number in AES system, maintenance level access is required through the web based GUI. Refer to Accessing the Maintenance Interface on page 3-33.

The GUI AES status summary screen lets the maintainer navigate to all applicable options. At the maintenance level, the Other Information & Control has an option to display/update the current Aircraft ID stored in the AES Configuration data. Refer to Figure 3-1 to change the AES aircraft ID information.

To just view the aircraft tail number information, the user level is required.

(1) At the GUI login, the username is "User" and there is no password.

The GUI AES status summary screen lets the user navigate to all applicable options. At the User level, the Other Information & Control has an option to display the current Aircraft ID stored in the AES Configuration data. Refer to Figure 3-1 for the AES aircraft ID information page.

B. View AES System Configurations

The AES system configuration includes the aircraft installation information.

<u>NOTE:</u> The AES System configuration file update is not a field activity. This is done by the equipment supplier as part of production process. On completion of AES system installation activities, the installer can view and verify the AES configuration settings through the GUI as described in this section.

To view and make sure the AES configuration data is correct, navigate to the "Configuration Files" information pages under the "Other Information & Control" menu. Figure 3-1 shows the typical configuration file Information page.

<u>NOTE:</u> The AES system does not lose its configuration data because of the loss of its primary power. The validity of the AES configuration content is determined by the AES system with a checksum process. The checksum is done at the time of each power-up. An invalid checksum results in the AES system reverting to the default values.

C. Regulatory Log Configuration Parameters

The regulatory log configuration parameters file contains details of the remote server to use to transfer the regulatory log data.

D. Aircraft Service Configuration

Page 3-5 16 Sep 2015

SYSTEM DESCRIPTION AND INSTALLATION MANUAL

JetWave[™] System

There are a number of functions that an Ethernet port can support namely, data traffic, data loading, GUI, AES logs extraction (maintenance function) and status/control (through the SNMP). The terminal can be configured to indicate whether an Ethernet port supports traffic, data loading, SNMP etc, such as AG1 SNMP, and data loading, EG1 traffic, using the aircraft service configuration file.

Once the items have been loaded into the APM the Modman reads the APM once at power-on and passes the appropriate data to the relevant LRU or uses the information locally.

A Honeywell proprietary configuration tool is used to generate the JetWave[™] configuration files, which are typically stored on the Airplane Personality Module (APM) LRU of the JetWave[™] system. The tool then takes these configuration files and produces an ARINC 665 package of files compatible with the Modman LRU 615A data loader. Figure 3-2 shows the JetWave[™] Configuration Tool GUI interface.

SYSTEM DESCRIPTION AND INSTALLATION MANUAL

JetWave[™] System

- · Weight on Wheels discrete input availability and its polarity
- User Ethernet Ports which are to be configured and the type of services to be enabled (such as Dataload, SNMP and GUI).
- Particulars of VAR/DPs providing the IP services
- Aircraft blockage data.

Refer to APPENDIX E on page D-1 for more details.

5. ARINC 615A Software Dataload Process

A. Introduction

The JetWave[™] LRUs are preloaded with a full software load and there is no need to perform field dataload under normal conditions during installation.

On completion of physical installation and interconnection of JetWave[™] LRUs in the aircraft, it is to be verified that the appropriate version of the JetWave[™] LRU operational data and APM configuration file is data loaded onto the JetWave[™] LRUs.

The JetWave[™] LRU operational data and APM configuration file are supplied as a media file. The software data load can be carried out when the media files are issued separately along with Service Bulletins for any in-service system updates.

Only Honeywell approved software is loadable onto JetWave[™] LRUs.

This section of the document supplies information on how to accomplish ARINC 615A data loading of JetWave[™] system in the field.

The data loading of JetWave[™] system is done while the aircraft is on ground. During the data load, there will not be any RF transmission.

B. System Requirements

For data load, the data loader is to be interfaced with Modman through the ARINC 600 Modman AV1 Ethernet port. The AES JetWave[™] Modman is designed to enter into data load mode when the discrete signal interface for Data load Enable is asserted (grounded) by ARINC 615A compliant data loading utility. The discrete input electrical specification is in accordance with the specification in ARINC 763 Section 2.9.6.

It is recommended that the Modman AV1 Maintenance port and Modman Data Load Enable discrete interface be wired for JetWave[™] AES data load and AES log extraction.

An ARINC 615A compliant data loading utility is recommended to be used for JetWave[™] AES data loading. The data loading software-based utility may be hosted on a PC architecture device such as an Electronic Flight Bag (EFB) or other portable computing device, an on-board portable device, or an avionics device. Since the Aircraft loading procedures can vary due to different type of uploading means, it is recommended to refer to the appropriate Aircraft Maintenance Manual before attempting data loading of JetWave[™] AES system.

C. Procedure

23-15-29

Page 3-7 16 Sep 2015

SYSTEM DESCRIPTION AND INSTALLATION MANUAL

JetWave[™] System

This section contains the instructions for data loading of JetWave[™] software to any of the JetWave[™] LRUs through the ARINC 600 AV1 (Maintenance Port) Ethernet interface of Modman. Data loading of JetWave[™] system can be performed while:

- JetWave[™] system is in normal operation
- During system initialization
- When in critical fault mode.

The maintenance operator is responsible for determining which loads are presented to the JetWave[™] AES system through Modman for data load. JetWave[™] AES system in turn will determine the files required to meet the data load request.

The JetWave[™] AES system data loading of all LRUs including uploading of the AES configuration data can be performed through Modman. For data load purpose, Modman acts as a gateway to JetWave[™] LRUs and LRUs themselves do the data load. It is not recommended to attempt field data load of JetWave[™] LRUs directly other than through Modman.

The system configuration file is stored in nonvolatile memory in the APM and does not lose its contents due to the loss of APM power.

On transfer of the loaded software, the Modman makes sure that the software presented by the data loader has been loaded correctly before responding that the load is complete and will report part numbers of the loaded software.

For illustration purpose, snap shots of AIT make F-SIM-LDR ARINC 615A data loader simulator are included as part of this document.

(1) Parts Needed:

- Object Media CD
- ARINC 615A compliant data loading utility. The JetWave[™] AES system software is loaded through the Modman.

The JetWave™ AES loadable software part, part number varies for each release.

(2) System Software/Database Updates

Under normal circumstances, time required to carry out data load operation of all JetWave[™] AES LRUs will not exceed 45 minutes for a fuselage mount systems and 60 minutes for a tail mount system.

The data sets as shown in Table 3-2 can be transferred through the data load port in Modman

LRU	Data Set	Transfer Process
Modman	JetWave™ Modman LRU Operational file	Upload only
АРМ	APM configuration file	Upload only, through the Modman

Table 3-2. Data Sets

SYSTEM DESCRIPTION AND INSTALLATION MANUAL

JetWave[™] System

Table 3-2. Data Sets(Cont)

LRU	Data Set	Transfer Process
KANDU	JetWave™ KANDU LRU operational file	Upload only, through the Modman
KRFU	JetWave™ KRFU LRU operational file	Upload only, through the Modman
OAE-FMA or OAE-TMA	JetWave™ OAE LRU operational file	Upload only, through the Modman

In the above listing, upload is defined as the transfer of a data set from the ARINC 615A data loader and a download is defined as the transfer of a data set from Modman to the ARINC 615A data loader. For JetWave[™] AES LRUs where data download operation is not supported, the system will return 0x1002 status code.

The ARINC 665 media package include *.LUM files for each of JetWave[™] LRUs. This along with LOADS.LUM and FILES.LUM are assembled to form a 665 package which include a manifest file as a compressed file format. The ARINC 665 media set of JetWave[™] system comprises of:

- LOADS.LUM: Describes the loads that the media device carries, one or more.
- FILES.LUM: Lists all the files, excluding itself, on the media.
- *.LUH is the load part index file which the LOADS.LUM points to.
- *.LUP is the data file which contains compressed software image/images and manifest files.

During the data loading process, the respective LRU unzips the file and extracts the manifest file and the images. Each LRU identifies the part for itself from the manifest file.

The .LUP files that follow are included as part of ARINC665 media file for different AES LRUs.

- Modman operational data
- AES configuration data
- KRFU operational image
- KANDU operational image
- OAE-TMA operational image
- OAE- FMA operational image.
- <u>NOTE:</u> More than one CONFIG sub parts may be present in a configuration load, one per AES configuration file type.

For the ARINC 615A data load operations, an A615A target connection must be defined. Target connection defines a TFTP client on the Modman and TFTP server on the data loader that will be used for file transfer.

Page 3-9 16 Sep 2015

SYSTEM DESCRIPTION AND INSTALLATION MANUAL

JetWave™ System

D. JetWave[™] Data Load Procedure

(1) General Preparation

- (a) Power up the AES system.
- (b) Power up the ARINC 615A compliant data loader and ensure data loader is interfaced with Modman and is ready to upload.
- (c) Load the media CD with the copy of the released JetWave[™] software and configuration file.

The media (CD) contains a configuration file and a file containing the software to be uploaded. The configuration file is located in the root directory of the media and is named CONFIG.LDR. This configuration file contains information for the data loader to configure itself for operation. The data loader reads the configuration file and initializes itself according to the parameters read.

- (d) Make sure that the AES system hardware configuration is correct. Refer to the Service Bulletin for part number validity.
- (e) The dialog box for the ATI make F-SIM-LDR ARINC 615A data loader is shown in Figure 3-3.

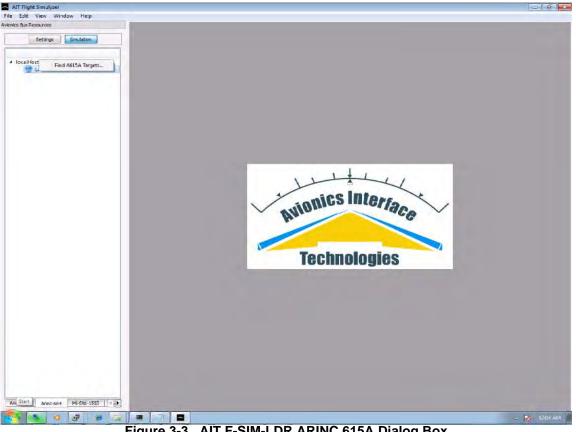

Figure 3-3. AIT F-SIM-LDR ARINC 615A Dialog Box

Page 3-10 16 Sep 2015

SYSTEM DESCRIPTION AND INSTALLATION MANUAL

JetWave[™] System

(2) **Preparation for Loading Software**

- (a) Click to bring up the 665 Media window on the data loader.
- (b) Select **Media Repository** and click **OK** button. Most of the data loader will automatically select the media repository folder and brings up the **Select Media Set** window.
- (c) In the **Select Media Set** window, the operator will be able to see the packaged software data files.

(3) FIND Loadable Targets

(a) The ARINC 615A FIND operation is used to identify available loadable target systems. The loadable targets responding to the FIND request will be shown after the timeout on the data loader, indicating target identification and source address (IP) information. Figure 3-4 shows the screen shot of AIT F-SIM-LDR ARINC 615A FIND dialog box.

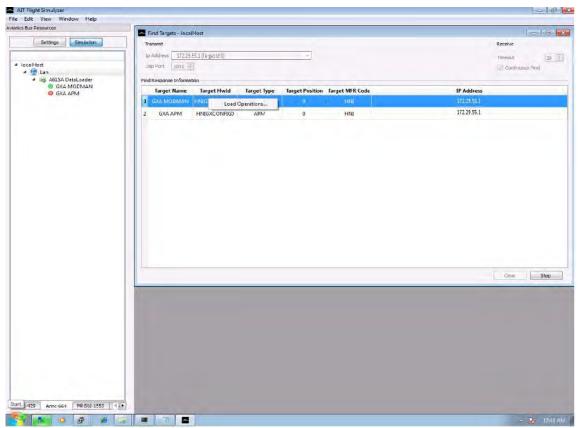

Figure 3-4. AIT F-SIM-LDR ARINC 615A Find Dialog Box

(b) For Data load operation, following static IP addresses are assigned to JetWave[™] AES LRUs.

Modman IP address: 172.29.55.1/24

KANDU IP address: 172.29.55.2/24

OAE IP address: 172.29.55.3/24.

Page 3-11 16 Sep 2015

SYSTEM DESCRIPTION AND INSTALLATION MANUAL

JetWave[™] System

(4) Getting Target Information

- (a) The ARINC 615A INFORMATION operation is used to retrieve software configuration information from a loadable target.
- (b) The Modman advertise two data load hardware targets, one for the Modman and the other for the AES Configuration, as follows:

Modman LRU:

- Target Hardware Identifier: "HNIGXMODMAN0"
- Target Type Name: "MODMAN"
- Target Position: "0"
- Literal Name: "JetWave™ MODMAN"
- Manufacture Code: "HNI".

APM Configuration Data:

- Target Hardware Identifier: "HNIGXCONFIG0"
- Target Type Name: "APM"
- Target Position: "0"
- Literal Name: "JetWave™ APM"
- Manufacture Code: "HNI".

(5) Data Upload

SYSTEM DESCRIPTION AND INSTALLATION MANUAL JetWave™ System

(a) The ARINC 615A UPLOAD operation is used to transfer the data files to the Modman.

The AIT F-SIM-LDR ARINC 615A data upload information dialog box screen shot is shown in Figure 3-5.

	Time Elapjed: 00:00:01			

Figure 3-5. AIT F-SIM-LDR ARINC 615A Data Upload Information Dialog Box

- (b) The UPLOAD process is initiated by selecting an individual LSAP or ARINC 665 media set containing one or more LSAPs.
- (c) In the Upload File Selection dialog, the Files of type: drop down list can be used to select if either a Media set (Loads(*.LUM)) or an individual LSAP (Header Files (*.LUH)) will be selected for the UPLOAD.
- (d) In the ARINC-665 Upload File Selection dialog window, the operator can view the list of files.
 - <u>1</u> The files can be selected either as a media set or an individual LSAP for the UPLOAD.
 - <u>2</u> Individual LSAPs are selected by choosing the Load Header (.LUH) (Header Files (*.LUH)) file associated with the load.
 - 3 For loading entire JetWave[™] AES media set, the Loads.LUM file at the root of the media set must be selected (Loads (*.LUM)).

23-15-29

Page 3-13 16 Sep 2015

SYSTEM DESCRIPTION AND INSTALLATION MANUAL JetWave[™] Svstem

- Update the field for target IP address of the JetWave™ Modman as 172.29.55.1 for (e) loading the entire JetWave™ AES media set.
- (f) Update the field for target IP address of the JetWave™ LRUs for respective LRU IP address and by choosing the Load Header (.LUH) (Header Files (*.LUH)) file associated for data load of respective JetWave™ AES LRUs.
- (g) Click Upload LSAPs.
- The data loader application initializes the uploading through an initialization message to (h) Modman to determine if it is operational.
 - On indication of the acceptance or the denial of this message request, the data 1 loader application notifies the status to the operator.
- (i) If the Initialization step is accepted, the data loader application will initiate the load list transfer by sending the list of loads which are to be uploaded which is analyzed by the Modman and sends its status.
 - If one of the loads is not accepted, it is recommended to reject the complete list. 1
- When the upload is complete, the Status Description field will display the message: (j)

"Upload Operation completed successfully".

Close the LSAP upload/upload schedule display. (k)

On completion of the data load, the software part numbers which are loaded into the system can be verified through the AES GUI interface or through the SNMP service.

6. **Cable Calibration**

The Modman will not transmit until it has been calibrated, with the transmit cable calibration. After the AES is physically installed and connected, the Modman will automatically initiate cable calibration during start-up.

The transmit cable calibration calibrates the terminal to allow accurate control of transmitter power, taking into account IF output loss, cable loss, and KRFU (BUC) performance. Transmit cable calibration uses the Open BMIP BUC interface. During calibration, the power amp of the BUC is disabled and the BUC must support PA disable.

For the Modman to operate normally:

- The Modman-ACM board calibration file must be present
- The KRFU-BUC calibration file must be present and the serial number must be equal to the BUC reported serial number
- The IF calibration file must be present.

If any of the conditions are not met, the Modman-ACM enters an inactive state, and deletes any IF calibration files. The ACM declares itself in need of calibration. When this occurs, the ACM enters a state whereby it awaits the command to proceed with the calibration, typically through the AES Menu Access System.

SYSTEM DESCRIPTION AND INSTALLATION MANUAL

JetWave[™] System

When calibration is completed successfully, the ACM proceeds to its configured mode of operation as if it had been restarted. When commissioning is not completed successfully, either due to an error condition or a user cancellation, the ACM enters an inactive state.

One Touch Commissioning (OTC) is available on the AES Menu Access System.

7. Post Installation System Checkout Procedures

A. General Overview

This section supplies the information required to determine the operational readiness of the JetWave[™] system, made up of the Modman, APM, KRFU, KANDU, and OAE FMA or OAE TMA.

The installed LRUs require operational and diagnostic testing for one of the reasons listed below:

- Operational verification tests that verify the operational readiness of the unit after installation on an aircraft.
- Fault verification and diagnostics to verify that a fault exists and produce system reports for trouble shooting purposes
- Operational verification of repairs that verify the operational readiness of units that have been repaired before re-installation on an aircraft.

Only qualified technical personnel, familiar with avionics systems, should perform the test procedures provided in this document. Before performing any test or fault isolation procedures, read the safety advisories.

B. System Power Supply

The JetWave[™] system LRUs are shipped with the operational software preloaded.

Make sure that the JetWave[™] LRUs are wired and all the receptacles are connected in accordance with applicable interconnection diagram.

Power up the JetWave[™] LRUs, close applicable aircraft circuit breakers to supply power. After 5 minutes, check the Modman front panel for the Modman status.

There are two LEDs on the front panel of Modman. One is for the power and the second one is for status. Use Table 3-11 to identify the current operating mode of Modman with the power LED indicating powered up status.

Status LED	Mode
Off	No electrical power / electrical power is supplied but prior to boot.
Flash green at a minimum of 10 seconds	Modman initialization
On - green	Modman in normal operation
On - red	Modman in Fault Mode

Table 3-11. Modman LED Status Indications

23-15-29

Page 3-15 16 Sep 2015

SYSTEM DESCRIPTION AND INSTALLATION MANUAL

JetWave[™] System

On completion of AES system installation activities, the installer can view and make sure that the JetWave[™] LRUs status, AES configuration settings, discrete input and output status, and antenna alignment status through the GUI as described in this section.

Once the Modman is powered up, the JetWave[™] GUI page can be accessed. The JetWave[™] system GUI service is supported on AV1 10/100 Base T Ethernet interface. The Modman static IP address assigned is 172.29.55.1 and the port no for the AES GUI service is 80.

Connect a laptop to the AV1 port of Modman through aircraft Ethernet interface. It is recommended to use a laptop computer with the following minimum requirements:

- Intel i5 CPU
- 8 GB of RAM
- At least 500 MB of available hard drive space
- An available 10/100/1000 Ethernet interface
- Windows 7 operating system, 64-bit.

On any of the Internet browser (Internet Explorer 8 compatible), open the link "index.html". Login page will be presented as the root page, allowing entry of the user name and password. Figure 3-6 shows the login page.

SYSTEM DESCRIPTION AND INSTALLATION MANUAL

JetWave[™] System

Modman Reset Input

- (1) Activate the Modman Reset by toggling Modman reset switch on the JetWave[™] AES control panel.
- (2) Monitor the Modman "power" and "status" LEDs flash continuously.
- (3) Toggle the Modman Reset switch on the Satcom test panel to the open/non-grounded position.
- (4) Monitor the "status" LED on the front of the Modman, progresses from red color to steady state green as seen during initial power-on.
- (5) Check for the Aircraft Tail number page and make sure that the aircraft tail number page is updated with the aircraft Tail number.

Navigate to the AES Summary and Link Status page and scroll down to see the ARINC 791 Discrete input and output state of the JetWave[™] system. Refer to Figure 3-12.

For illustration, the figure that follows shows the AES discrete signal state. Use the wired aircraft interfaces to toggle and see if the applicable discrete are asserted or de-asserted.

C. ARINC 429 Input Interface Testing

For the operation of JetWaveTM system, the aircraft must have a functional IRS providing ARINC 429 labels to KANDU. Functional IRS is interfaced with the KANDU through Receive only ARINC

23-15-29

Page 3-21 16 Sep 2015

SYSTEM DESCRIPTION AND INSTALLATION MANUAL

JetWave[™] System

429 interface through which the required ARINC 429 labels as defined in APM configuration file are made available.

Navigate to the AES Summary and Link Status page and scroll down to see the aircraft status. Refer to Figure 3-13.

This page will be updated with current latitude and longitude position of the aircraft.

Once the JetWave[™] system starts receiving the valid navigational input from aircraft IRS system, make sure that the values are correct as compared to the aircraft navigational system outputs.

Figure 3-13. Aircraft Statuses

D. Manual Steering of the Antenna

To do a commanded test to manually steer the antenna, navigate to "Manual Antenna Steering" under the commanded test menu. Monitor the antenna movement in accordance with the commanded test fed through the GUI tool. Refer to Figure 3-14.

<u>NOTE:</u> In order to see the antenna movement, the radome can be removed. If it is an OAE-TMA, Honeywell recommends manually steering the TMA through GUI to a safe antenna orientation position before removal. The TMA parking position is included in the AES System Configuration File, which can be accessed through the GUI web interface and by navigating to Configuration File page. Consult aircraft specific SDIM for detailed instructions.

Figure 3-14. Manual Antenna Steering

E. Antenna Calibration Testing

Do the Antenna Calibration in accordance with the detailed instructions in TMA Alignment or FMA Alignment section.

Navigate to Antenna Calibration Status under the commanded test menu and make sure that the current calibration status, calibration is "Aligned".

F. Cable Calibration Testing

Do the cable calibration, navigate to the "Calibrate Transmit Cable" page under the commanded test menu.

Make sure that the cable calibration is completed successfully. The cable calibration page is shown in Figure 3-15.

G. ARINC 615 Data Load

Do the data load as detailed in ARINC 615A Software Dataload Process section. Make sure that the data load operation is completed successfully.

H. System Available (Cockpit Control Panel) Output

Once the JetWave[™] system is powered up, monitor the "System Available" status discrete. Make sure that the discrete state agrees with the discrete output in the GUI.

I. Data Link Available (Control Panel) Output

Once the network connectivity is achieved, the "Datalink Available" discrete output on the ARINC 791 page will be asserted.

To see the "Datalink Available" discrete output, navigate to the AES Summary and Link Status page and scroll down to see the ARINC 791 page and make sure the discrete output status is asserted, Refer to the Discrete I/O state page Figure 3-12.

Make sure the "Datalink Available" status is indicated in control panel.

J. Network Status

Navigate to the AES Summary and Link Status page and scroll down to see the Network status of the JetWave[™] system.

An example of a AES network status is shown in Figure 3-16.

Page 3-24 16 Sep 2015

SYSTEM DESCRIPTION AND INSTALLATION MANUAL

JetWave[™] System

Make sure that the network connectivity in accordance with the aircraft configuration plan.

With the use of another laptop, make sure that the network connectivity on each active port once the data link available output is available.

Begin a two way (Rx and Tx) video conference call with a tool such as Microsoft Lync or Skype. Make sure that the availability of the uninterrupted data connectivity. Monitor the Kilobytes sent and received fields on the home page.

While the JetWave[™] system is up and connectivity to internet is established, move the aircraft around in a circular 360 degree pattern (no faster than 3° per second).

Verify that the connectivity remains available through the 360 degrees turn by monitoring the datalink status discrete.

Connect to each of the configured Ethernet port to make sure there is data connectivity.

K. EMC Interference to Other Systems

- (1) Power up the system and let it acquire to the network.
- (2) Begin a two way (Rx and Tx) video conference call with a tool such as Microsoft Lync or Skype.
- (3) Test the functioning of other communication systems with antennas installed adjacent to the FMA or TMA and observe for any mutual interference.
- (4) Monitor the link signal quality C/N and E_b/N_o parameters. These parameters are found under Aircrarft Statuses as part of the AES Summary and Link Status page. Refer to Figure 3-13.

Page 3-25 16 Sep 2015

SYSTEM DESCRIPTION AND INSTALLATION MANUAL

JetWave[™] System

(5) In case of any RF interference, there will be significant variation of the C/N and E_b/N_o parameters.

8. Post-Installation Troubleshooting

A. System Fails Post-installation Checks

- (1) To make sure that the system is correctly installed, do as follows:
 - (a) Make sure that the APM has been correctly configured and loaded. Refer to "ARINC 615A Software Dataload Process" and "Troubleshooting" to access the GUI to check that the correct APM version is installed.
 - (b) Make sure that all the LRUs and connections have been correctly installed.
 - <u>1</u> Do continuity checks on wiring, test RF cables with specialized RF cable testers, and do power on and ground checks with LRUs disconnected for the check.
 - (c) Make sure that all LRUs power up.
 - 1 System status can be viewed at the AES Home and Status Info Page Figure 3-7
 - (d) Make sure that the cable calibration procedure been done. Refer to Cable Calibration on page 3-14.
 - (e) Make sure that the navigation data is correct and the antenna alignment has been done.
 - Refer to Installation Section 4.Q. TMA and FMA Antenna Alignment Procedure on page 2-36.
 - (f) Check for system internal interconnect faults. Refer to JetWave[™] System Fault Codes on page 3-41.
 - (g) Make sure the system is connected correctly to the navigation busses, check the system for No traffic faults on the A429 ports. If No traffic faults are received, do as follows:
 - <u>1</u> Check wiring and or make sure that the APM is configured for how the system is wired.
 - (h) Check the system for User port Ethernet No layer 1 faults. If faults are received, do as follows:
 - <u>1</u> Check the APM for correct configuration.
 - 2 Make sure that the connecting equipment is operating correctly.
 - <u>3</u> Check the wiring.
 - (i) Make sure that the system has the correct software loaded. If so, do as follows:
 - <u>1</u> Check for LRU software errors.
 - <u>2</u> Check for LRU hardware / software incompatibilities.
 - <u>3</u> Check the system for software incompatibilities.

B. Incorrect Navigation Data

SYSTEM DESCRIPTION AND INSTALLATION MANUAL

JetWave[™] System

- (1) If the system is reporting labels missing, do as follows:
 - (a) Check that the APM is configured to have correct labels on the correct bus.
 - (b) Make sure that the labels are present on bus.
- (2) If the system is reporting an incorrect label status on the bus (FW, NCD, FT), do as follows:
 - (a) Wait for equipment providing the labels to report Normal Operation.

C. System Will Not Connect to the Network

- (1) View the AES Home and Status Info Page Figure 3-7 to see reason transmission is muted and address the reasons.
- (2) Make sure the system is not limited by geographical restraints.

The system can only transmit in authorized areas and will report if it cannot transmit for this reason.

- (3) Make sure you have clear line of sight to the satellite.
- (4) Make sure the system has been activated by the ISP.
- (5) Make sure that the system is not configured for data loading.

The system will not transmit while the local data enable switch is closed.

D. Connectivity of Each Ethernet Port

NOTE: The JetWave[™] system configuration files are update by the field. The creation files are not loaded by the field. This is done at the factory as part of production process with a Honeywell proprietary tool. Honeywell can be contacted for generating the creation file. On completion of AES system installation activities, the installer can view and verify the AES configuration settings through the GUI as described in this section.

To view and verify the AES system configuration, a web based GUI is supplied. The JetWave[™] Ethernet configuration data can be viewed and verified by navigating to the "Contents of Aircraft Services Configuration Files" page from "Configuration Files" under the Other Information & Control menu. Figure 3-8 shows the typical configuration file Information page.

The network status and the VLAN ID can be viewed as shown in Figure 3-16.

The IP address assigned can be viewed by pressing the "Display" tab of Contents of Aircraft Configuration File as shown in Figure 3-17.

Figure 3-17. Contents of Aircraft Services Configuration File

There are a number of functions that an Ethernet port can support namely, data traffic, data loading, GUI, AES logs extraction (maintenance function) and status/control (through the SNMP).

The terminal can be configured to indicate whether an Ethernet port supports traffic, data loading, SNMP, etc, such as port PA1 configured for engineering SNMP and AES access services. Refer to Figure 3-16. It contains the parameters that follow:

- User Port PA1/2/3/4/PG1/EN5/6/7/8/EG1/AV1/2/3/AG1 data load
- Data Load IP Modman
- Data Load IP KANDU
- Data Load IP OAE

Page 3-28 16 Sep 2015

SYSTEM DESCRIPTION AND INSTALLATION MANUAL

JetWave[™] System

• User Port IP filter 1 thru 150.

Once the items have been loaded into the APM the Modman reads the APM once at power-on and passes the appropriate data to the relevant LRU or uses the information locally.

- (1) If the Ethernet port is not active, do as follows:
 - (a) Check the APM settings, as follows:
 - <u>1</u> Make sure that the port is enabled.
 - 2 Check system errors.
 - <u>3</u> Check for system reporting No layer 1 or No traffic faults.
 - (b) Is the device connecting to it operating correctly? If so, check the wiring.
- (2) It there is poor performance on one port only, do as follows:
 - (a) Check for port reporting high packet loss. If so, check wiring and verify that there is traffic.
- (3) If not supplying access to the correct services, do as follows:
 - (a) Make sure the APM is configured for the correct services.
 - (b) Make sure the APM is configured to access the correct VLANs.
 - (c) Check with the service provider to make sure that the VLANs have been correctly configured for the terminal.

9. Maintenance and Repair

A. Maintenance Requirements

- (1) The maintenance-free design of the JetWave[™] AES system does not require field maintenance to maintain airworthiness.
- (2) Maintenance for the JetWave[™] AES system is limited to replacement of LRUs on verified failure.
- (3) Field lubrication or other maintenance procedures are not required for fuselage mount antenna assembly / tail mount antenna assembly where there are moving mechanical parts.
- (4) If functional problems occur, the BITE can identify the faulty JetWave[™] AES LRU and the Modman collates this BIT information which can be accessed through the GUI provided. Refer to theRefer to BITE Philosophy on page 3-41 of this document for information on how to access the BIT data.

If replacement of the unit is deemed necessary, in consultation with Honeywell product support, It is strongly recommended that all repairs be performed only at the Honeywell authorized facility.

B. Continued Airworthiness, FAR 25.1529

The sections that follow supply instructions for continued airworthiness for the JetWave[™] AES system. The sections that follow are supplied in response to Federal Aviation Regulation 25.1529, Instructions for Continued Airworthiness.

Page 3-29 16 Sep 2015

SYSTEM DESCRIPTION AND INSTALLATION MANUAL

JetWave[™] System

C. Airworthiness Limitations

- (1) Installation of the JetWave[™] AES OAE assembly and LRUs on an aircraft by supplemental type certificate (STC) or Form 337 obligates the aircraft operator to include the maintenance information supplied by this manual in the operator's Aircraft Maintenance manual and the operator's Aircraft Scheduled Maintenance Program.
- (2) It is recommended that this section be appended to the Airplane Maintenance Manuals. The information contained herein supplements the Airplane Maintenance Manuals in areas covered by the JetWave[™] AES FMA/TMA installation.
- (3) It is recommended to consult basic Airplane Maintenance Manuals for limitations and procedures not contained in this supplement. The inspections and airworthiness limitations specified in this section are FAA approved.
- (4) This section and the sections that follow specifies the inspections and other maintenance required under sections 433.16 and 91.403 of the Federal Aviation Regulations unless an alternative program has been FAA approved.

Initial and recurring inspections of the JetWave[™] AES OAE assembly and LRUs and its associated provisions are required. Specific inspection intervals are contained in Table 3-12.

D. General Instructions for Inspection

This section provides general instructions for the inspection of the JetWaveTM AES OAE assembly and LRUs .

- (1) Gain access to the installation location on the fuselage for fuselage mount antenna assembly or to the top of the aircraft vertical stabilizer in the case of tail mount antenna assembly
- (2) Clean all visible surfaces of the antenna, radome assembly, and base plate.
 - (a) Do the inspections and checks presented in Electrical and Mechanical Inspection and Check.

E. Electrical and Mechanical Inspection and Check

Periodic inspections of the mechanical and electrical interfaces of the JetWave[™] AES OAE assembly and LRUs to the aircraft should be completed as defined by the governing airworthiness body (such as Transport Canada, the FAA, or the JAA) Instructions for Continued Airworthiness for the installation.

For the general guidelines refer to Visual Inspection and Check and Scheduled Maintenance and Inspections sections.

F. Scheduled Maintenance and Inspections

- (1) The JetWave[™] AES system does not require routine maintenance for continued airworthiness.
- (2) Scheduled inspections items in Table 3-12 must be done at a minimum of once a year preferably scheduled along with the other annual maintenance activities.
- (3) It is recommended to periodically check JetWave[™] AES cable connectors and, if required, tighten connectors to recommended value.

Page 3-30 16 Sep 2015

SYSTEM DESCRIPTION AND INSTALLATION MANUAL JetWave™ System

(4) It is recommended to follow the Standard Practices Chapter of the Aircraft Maintenance Manual and do all required inspections and repairs.

SI No.	Item	Interval	Potential Damage Inspection	Inspection
	Lightning diverters	In accordance with the aircraft inspection schedule and after flying in known conditions of lightning	Paint damage, structural damage, de-lamination	External visual
	Fuselage mount radome exterior, radome skirt exterior / tail mount radome exterior	In accordance with the aircraft inspection schedule and after flying in known conditions of lightning/hail.	Paint damage, structural damage, de-lamination, puncture	External visual
	Antenna interface mount	In accordance with the aircraft inspection schedule	Corrosion, loose, or missing fasteners	External visual
	OAE – FMA/TMA connectors	In accordance with the aircraft inspection schedule	Corrosion, loose, or missing connectors	External visual
	OAE-FMA/TMA grounding and bonding	In accordance with the aircraft inspection schedule	Non conform electrical bonding	External visual and 5 m Ω test
	OAE-FMA/TMA wiring	In accordance with the aircraft inspection schedule	Chafing, cracks in insulation, breaks	External visual
	KANDU connectors	In accordance with the aircraft inspection schedule	Corrosion, loose, or missing connectors	External visual
	KANDU grounding and bonding	In accordance with the aircraft inspection schedule	Non conform electrical bonding	External visual and 5 m Ω test
	Modman and APM connectors	In accordance with the aircraft inspection schedule	Corrosion, loose, or missing connectors	External visual
	Modman and APM grounding and bonding	In accordance with the aircraft inspection schedule	Non conform electrical bonding	External visual and 5 m Ω test

Table 3-12. Scheduled Maintenance

G. Unscheduled Maintenance

(1) Follow the Standard Practices Chapter of the Aircraft Maintenance Manual and do all the required inspections and repairs, as shown in Table 3-13.

23-15-29

Page 3-31 16 Sep 2015

SYSTEM DESCRIPTION AND INSTALLATION MANUAL

JetWave[™] System

Table 3-13. Unscheduled Maintenance

	ltem	Potential Damage	Inspection
JetWave™ AES FMA	Heavy rain / hail	Paint erosion	External visual
OAE/TMA OAE	bird strike	Paint damage/radome puncture	External visual
JetWave™ AES system Failure	NA	NA	Removal

- (2) JetWave[™] AES system status can be viewed through the GUI. Refer to Checking Status Information section for description.
- (3) On the Modman LRU the status indicator LED is on the Modman front panel. The various Modman status indications are shown in Table 3-14.

Status LED	Mode
Off	No electrical power / electrical power is supplied but prior to boot.
Flash green at a minimum of 10 seconds	Modman initialization
On - green	Modman in normal operation
On - red	Modman in Fault Mode

Table 3-14. Modman LED Status Indications

H. Repair Requirements

- (1) The BITE functionality of JetWave[™] AES system can identify the faulty LRU in case any occurrence of functional problems and this can be accessed through Modman.
- (2) In accordance with continued airworthiness instructions, if a JetWave[™] AES system is inoperative, use Standard Practices Chapter of the Aircraft Maintenance Manual to:
 - Remove the unit
 - Secure cables and wiring
 - Collar applicable switches and circuit breakers, and placard them as "inoperative".

Before flight, revise the equipment list and weight and balance data as applicable, and record the removal of the unit in the log book. Refer to section 91.213 of the FAR or the aircraft's minimum equipment list. All repairs must be done at the Honeywell factory.

10. Troubleshooting

This section supplies troubleshooting procedures for JetWave[™] system. Airline maintenance engineers can troubleshoot JetWave[™] system on the ground, with the Health Status Information and Fault Details and Isolation assistance displayed on the AES GUI.

SYSTEM DESCRIPTION AND INSTALLATION MANUAL

JetWave[™] System

Only qualified avionics personnel who are knowledgeable in the technical and safety issues related to the troubleshooting of aircraft communications equipment should do the troubleshooting procedures supplied in this manual.

<u>NOTE:</u> If any of the KANDU unmonitored voltage rails are not working the troubleshooting output of the JetWave[™] system would not identify the problem directly.

A. Accessing the Maintenance Interface

- (1) For maintenance activities, the JetWave[™] system can be accessed through a GUI.
- (2) The GUI service is supported on AV1 and AG1 10/100 Base T Ethernet interface.

<u>NOTE:</u> Once the configuration file is loaded, the ports where the GUI is available on can be different.

- (3) The Modman static IP assigned is 172.29.55.1 and the port number for the AES GUI service is port 80.
 - <u>NOTE:</u> This port is configured by the AES configuration user port services support information.
- (4) On any of the Internet browsers (Internet Explorer 8 compatible), open the link "index.html".
- (5) Login page will be shown as the root page, for you to enter the user name and password. Refer to Figure 3-18 for the screen-shot of the login page.

B. Checking Status Information

- (1) The health status of the JetWave[™] system can be monitored by selecting AES Summary and Link Status under the Health Status pane menu. Figure 3-20 shows the GUI page listing the health status of JetWave[™] system LRUs.
 - (a) In the health status page, the GUI lists the last five AES failure codes.
 - (b) The JetWave[™] system will enter into critical fault mode when critical LRU fault encountered or the AES Configuration data is missing or invalid.
 - (c) The JetWave[™] system will be back to normal operation mode only when all the LRU critical faults are removed, receiving valid navigation information, and a valid AES configuration data is supplied. Figure 3-20 shows the AES Summary and Link Status page.

Figure 3-18. JetWave™ Summary and Link Status (Sheet 2 of 2)

(2) The JetWave[™] system status can be viewed through the GUI. Refer to AES system status verification section on page 3-5 for description.

C. Downloading LRU Logs

- (1) To view the hystorical fault logs, under the AES historical logs pane, select the "Fault Log". A screenshot of fault log page is shown in Figure 3-19.
 - <u>NOTE:</u> The JetWave[™] System Usage log and the Operational log can be downloaded through GUI with User access level. For downloading the JetWave[™] System Fault log and the Security records, the system must be accessed through the Maintenance access level on the GUI.
- (2) The log files can be viewed a number of ways. You can choose how many resords as follows:
 - Since power on
 - Number of days and select actual number of days from the dropdown
 - Number of latest records and select the number of records form the dropdown
- (3) Select the record order by clicking on latest first or oldest first.
- (4) Select the Apply button.

Page 3-38 16 Sep 2015

SYSTEM DESCRIPTION AND INSTALLATION MANUAL

JetWave[™] System

D. System Dataload Failure

- (1) Make sure that the system is configured for ground operation.
- (2) Make sure that the local data load enable switch is closed.
- (3) Make sure that the 615A data loader is connected to the correct port:

<u>NOTE:</u> AV1 by default, but this may have been modified by the configuration loaded on the APM.

(4) Make sure you are trying to load a valid set of files into the correct LRU.

11. Network Monitoring

The JetWave[™] system supplies network performance data to SNMP applications. The available MIB objects and traps can be found in APPENDIX B on page B-1.

12. System Reset

The JetWave[™] system can be reset with any of the methods that follow:

- Through the Web GUI
- Through the SNMP
- By closure of the Modman reset pin (MP10C) to ground.

<u>NOTE:</u> The maintenance technician can attempt to cycle power to the Modman in case the system fails to respond to the reset. If the problem persists, the respective AES sub assembly needs to be replaced. Honeywell Field Support Engineers can be contacted for further support.

A. Electrical and Mechanical Inspection and Check

Periodic inspections of the mechanical and electrical interfaces of the JetWave[™] AES OAE assembly and LRUs to the aircraft should be completed as defined by the governing airworthiness body (such as Transport Canada, the FAA, or the JAA) Instructions for Continued Airworthiness for the installation.

For the general guidelines, refer to Visual Inspection and Check and Scheduled Maintenance and Inspections sections.

B. Instructions for Continued Airworthiness

This section supplies the special instructions and maintenance requirements for continued airworthiness of the JetWave[™] AES subsystems.

- JetWave[™] AES OAE assembly and LRUs are considered on-condition units. No additional or routine maintenance is required for the on-condition JetWave[™] AES OAE assembly and LRUs.
- (2) If a JetWave[™] AES OAE assembly or an LRU is inoperative, do as follows:

23-15-29

Page 3-39 16 Sep 2015

SYSTEM DESCRIPTION AND INSTALLATION MANUAL

JetWave[™] System

- (a) Remove the unit
- (b) Secure cables and wiring
- (c) Collar applicable switches and circuit breakers
- (d) Placard the JetWave[™] AES LRU and associated items as "inoperative" in accordance with the aircraft maintenance manual
- (e) Before flight, do as follows:
 - <u>1</u> Record the removal of the unit in the log book
 - 2 Revise the equipment list. Refer to section 91.213 of the FAR or the aircraft's minimum equipment list.
 - <u>3</u> Revise the weight and balance data as applicable.
- (3) JetWave[™] AES system LRUs are not field-repairable. Return the faulty LRUs or sub assembly to the Honeywell authorized facility for repair.
- (4) Install repaired LRUs on the aircraft in accordance with the installation instructions supplied in this manual.
- (5) Make sure that all repaired units operate correctly before you approve them for return to service, with the operational verification tests and procedures provided in this SDIM. Approval for return to service must be entered in the logbook as required by section 43.9 of the FAR.
- (6) Enter the approval for return to service in the appropriate logbook as required by FAR Section 43.9.
- (7) Add the scheduled maintenance tasks to the aircraft operator's appropriate aircraft maintenance program as follows:
 - (a) Recommended periodic scheduled servicing tasks: None required.
 - (b) Recommended periodic inspections:
 - Scheduled maintenance inspections supplied in Table 3-12 and in accordance the aircraft's inspection and maintenance schedule.
 - (c) Recommended periodic scheduled preventative maintenance tests (to determine system condition and/or latent failures): None required.

C. Visual Inspection and Check

Do the procedures that follow to examine the JetWave[™] AES OAE assembly and LRUs after installation of the unit onto the aircraft. Follow all approved safety standards and practices during the inspection.

<u>CAUTION:</u> FAILURE TO DISCONNECT CIRCUIT BREAKERS CAN LEAD TO INJURY TO THE OPERATOR AND DAMAGE TO THE EQUIPMENT.

(1) Disconnect all circuit breakers to the JetWave[™] AES OAE assembly, LRUs and associated systems.

Page 3-40 16 Sep 2015

SYSTEM DESCRIPTION AND INSTALLATION MANUAL

JetWave[™] System

- (2) Visually examine the FMA or TMA radome for any damage or defects.
 - (a) Remove the JetWave[™] AES OAE FMA or TMA assembly and LRUs from service if you find:
 - Punctures in the radome
 - Cracks in the radome
 - Chips, nicks, or gouges more than 0.250 inch (6.35 mm) across in any direction
 - Erosion lamination because of impact more than 0.250 inch (6.35 mm) across in any direction
 - Erosion of lamination because of impact more than 0.031 inch (0.79 mm) from the exterior surface of the radome
 - Damaged areas within 4 inches (101.6 mm) of each other
 - Any damage because of lightning.
- (3) Examine the connection for loose, damaged, or missing hardware.
- (4) Examine each lightning diverter strip.
 - (a) Remove the JetWave[™] AES OAE FMA or TMA assembly from service if:
 - · Three or more sequential buttons are missing on a lightning diverter strip
 - More than 10 percent of the buttons are missing on a lightning diverter strip
 - The lightning diverter strip is burned or scorched through to the radome material.
- (5) Examine the base plate.
 - (a) Remove the JetWave[™] AES OAE FMA or TMA assembly from service if:
 - A corrosion area is greater than 1/8 inch (3.16 mm) across
 - There is damage to greater than 10 percent of the area thickness.
- (6) Examine cables and connections.
 - (a) Contact Honeywell to gauge the severity of the damage if you find:
 - Corrosion
 - Chafing
 - Wear
 - Damage.
- (7) Tighten any loose connectors to the manufacturer's recommended value.

13. JetWave[™] System Fault Codes

- A. BITE Philosophy
 - (1) Description

Page 3-41 16 Sep 2015

SYSTEM DESCRIPTION AND INSTALLATION MANUAL JetWave™ System

- (a) The JetWave[™] AES consists of the Modman, KANDU, KRFU, TMA or FMA LRUs, plus the APM.
- (b) The APM is a simple memory device with no software and performs no BITE by itself. Any BITE required for the APM is performed by the Modman. The APM is not shown in these diagrams.
- (c) The BITE system divides the responsibility for BITE and historical logs in a BITE hierarchy as illustrated in Figure 3-22.

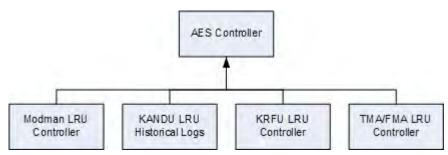

Figure 3-22. Bite Hierarchy

- (d) In charge of JetWave[™] system is the AES controller. This controller is in charge of the LRUs of the JetWave[™] system, and it:
 - Maintains the overall state of the AES system
 - Controls the initialization and operation of the system
 - Generates BITE events applicable to the system level
 - Records BITE events reported by a LRU and itself in an AES historical log.
- (e) Each LRU has a LRU controller that:
 - Maintains the state of the LRU
 - · Generates BITE events applicable to the LRU
 - Sends relevant BITE events to the AES controller (for the AES controller to make a decision on overall AES state, and for it to record in its AES historical log).
- (f) The diagram that follows is a detailed description of how the AES controller, the LRU controllers, the historical logs, and the means of access to those logs interact. Refer to Figure 3-23.

SYSTEM DESCRIPTION AND INSTALLATION MANUAL

JetWave[™] System

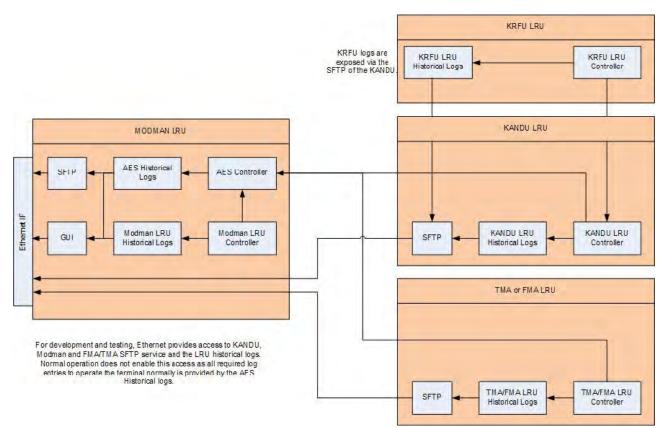

Figure 3-23. AES and LRU Controller Interaction

- (g) The AES Controller resides in the Modman LRU.
- (h) Each LRU Controller monitors the LRU for BITE events. BITE events are classified into two categories:
 - Faults: These are BITE events which have a SET state (occurring) or CLEAR state (fault has disappeared).
 - Events: These are BITE events which occur but do not have a set or clear state.
- (i) The LRU records the BITE event into a specific LRU log, dependent on the type of fault or event.
 - <u>NOTE:</u> Not all BITE events indicate an error situation. BITE events are also used for storing significant events in the historical logs, either on the LRU or in the AES controller, or for informing the AES controller of important system wide information.
- (j) BITE events are sent to the AES controller. The AES controller may react to an event by changing the overall state of the AES system. Actions include disabling the system, rebooting the system, etc.

23-15-29

Page 3-43 16 Sep 2015

SYSTEM DESCRIPTION AND INSTALLATION MANUAL

JetWave[™] System

- (k) The AES controller has a sub-part called the AES controller fault and event handler which is in charge of responding to BITE events reported by the AES controller or a LRU controller. This is mentioned in some reaction tables described below.
- (I) The AES controller has its own historical logs which allow it to record events about the whole system.
- (m) Included on the diagram are the Secure File Transport Protocol (SFTP) services and the GUI services which allow the users to access the AES and LRU historical logs.
 - AES controller logs are available from the Modman LRU GUI or SFTP service, accessible through one of the Ethernet connections on the Modman.
 - Modman LRU logs are available from the Modman LRU SFTP service, accessible through one of the Ethernet connections on the Modman.
 - KANDU LRU Logs and KRFU LRU Logs are available from the KANDU LRU SFTP service, accessible through one of the Ethernet connections on the Modman.
 - TMA/FMA LRU Logs are available from the TMA/FMA LRU SFTP service, accessible through one of the Ethernet connections on the Modman.
- (n) The LRU and AES remember information about BITE events that have occurred, in both non-volatile memory and volatile memory.
- (o) The historical logs are kept by the LRU and AES controller.
- (p) Each BITE event is described by an LRU code, encoded in three numbers (L1, L2 and L3) to uniquely identify the event.
- (q) Section 5 has more details on the format of this LRU code system.
- (r) The BITE events themselves have a description of the L1 thru L3 code and the additional text to be used for that event.
- (s) Each BITE event is also associated with a reaction table which describes the confirmation actions, and event actions, the LRU should take when this BITE event occurs. For events that are reported to the AES controller, there is a reaction table describing what the AES controller should do when the event is reported to it.

SYSTEM DESCRIPTION AND INSTALLATION MANUAL JetWave™ System

(2) Status Memory

- (a) The AES Controller remembers the following information:
 - The AES Controller maintains an overall mode of operational state, of UNKNOWN (Default), DATA LOAD, CRITICAL FAULT, COMMANDED MODE, OPERATIONAL MODE.
 - The AES controller maintains an overall service state, of AVAILABLE (default) or UNAVAILABLE. This service state, when set to UNAVAILABLE, disables user servicer and transmission.
 - For each unique L1 thru L3 code, maintained across reset/power down, it records if the code has occurred (SET), cleared after occurring (CLEAR), or never seen (NO_ERROR).
 - For each unique L1 thru L3 code, maintained across reset/power down, it records the number of occurrences and the time of the last occurrence.
 - For every link in the system, it records the status: UNKNOWN (default after power on), DISABLED, INACTIVE, NO_LAYER_1 (when applicable), HIGH_PACKET_LOSS, ACTIVE (normal). It also records the time of the last report, and the long term link status: NOFAULT, FAULT.
 - For every ARINC 429 label the AES accepts on a per LRU basis, it records the status: DISABLED, UNKNOWN (default after power on), ACTIVE, SSMERROR, MISSING.
 - For every input discrete the AES LRUs possesses, it records the status: UNKNOWN (default after power on), ASSERTED, DEASSERTED.
 - For every temperature sensor on every LRU the AES controller records its status: NORMAL (default after power on), WARNING, CRITICAL.
 - For the Modman, KRFU, KANDU, TMA, FMA the AES controller records it overall hardware state: NORMAL (default after power on), WARNING, FAILED.
 - The AES controller maintains in memory the mute state of each LRU, and the reason for mute. Default is "INITIALIZATION".
- (b) The LRUs remembers the following information:
 - For each unique L1 thru L3 code, maintained across reset/power down, it records if the code has occurred (SET), cleared after occurring (CLEAR), or never seen (NO_ERROR).
 - For each unique L1-L3 code, maintained across reset/power down, it records the number of occurrences and the time of the last occurrence.
 - For every link the LRU has, it records the status: UNKNOWN (default after power on), DISABLED, INACTIVE, NO_LAYER_1 (when applicable), HIGH_PACKET_LOSS, ACTIVE (normal). It also records if the link is causing a mute of the system.

Page 3-45 16 Sep 2015

SYSTEM DESCRIPTION AND INSTALLATION MANUAL

JetWave[™] System

- For every ARINC 429 label the LRU understands, it records the status: DISABLED, UNKNOWN (default after power on), ACTIVE, SSMERROR, MISSING. It also records if the label is causing a mute of the system.
- For every input discrete the LRU possesses, it records the status: ASSERTED, DEASSERTED.
- The LRU maintains in memory the reason, if any, for muting.

B. LRU Codes

BITE event information is encoded by the LRUs in three values. The values are named L1 thru L3:

- L1 denotes the LRU or interface (generated by an LRU on its behalf) which is generating the event
- L2 denotes the Shop Replaceable Module within an LRU for a event relating to an LRU, or for interfaces it denotes an particular part of the interface which is generating the event.
- L3 further defines the unique event that occurred.

Each fault or event also has an additional text field which can carry additional information helpful to understand the fault or event that happened.

The combination of L1 thru L3 alone uniquely identifies a BITE event in the system.

C. L1 Codes

(1) The event L1 code uses two hexadecimal digits to identify a LRU or an interface within an AES LRU, coded as follows:

Group	L1 Code	L1 Description
System	0x 00	System The L1 code of 00 shall be used if the LRU is unknown or if the error is applicable to a system level, such as an invalid or unknown system configuration error, or a system event not specific to an LRU.

PODD Network: Ethernet PA4 (94)		

Table 3-19. L2 Codes – User Interface

E. L3 Codes

- (1) The L3 code is four hexadecimal digits, used to uniquely identify the fault or event against an L1, L2 code pair.
- (2) Each LRU defines their own L3 codes. These are given in the fault table, refer to Table 3-20.

Table 3-20. L3 Codes

L1	L2	L3 Code	L3 Description	Repair Action
System (00)	Unknown (00)	0x 0001	OAE not pointed correctly	Try a manual point and see if it works.
	Mode (01)	0x 0000	Critical fault mode entry	- Info events - Recording what happened
		0x 0001	Dataload mode entry	in the LRU. - If it is a warning, It is info only.
		0x 0002	Commanded mode entry	
		0x 0003	Normal mode entry	
	AES menu access level (02)	0x 0000	Maintenance

JetWave[™] System

APPENDIX B

1. MIB Objects

A. MIB Structure

(1) SNMP applications can monitor the MIB objects. The Modman implements the Honeywell engineering SNMP MIB with OIDs as shown in Figure B-1.

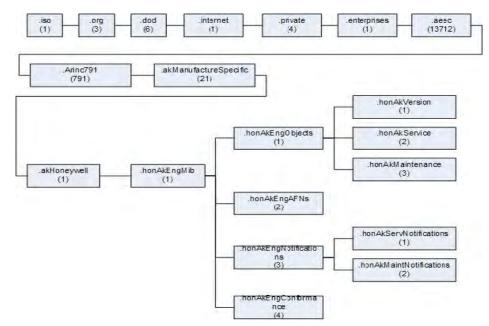

Figure B-1. MIB Object Structure

- (2) The Honeywell engineering SNMP service provides information to the external entity covering two areas of concern, link/service status and maintenance/BITE status. The data is provided through the SERVICE MIB and MAINTENANCE MIB.
- (3) Access to the branches on the MIB is controlled by having four levels of user access that range from the lowest of "User" to "Maintenance" followed by "Factory" and to the highest level of "Engineering". The "User" level is not password protected but the other levels require a password to access the services. To access the User or Maintenance levels do as follows:
 - Access the user interface with Username: "User" and no password.
 - Access maintenance interface with Username: "Maintenance" and Password: "Earthbound".

SYSTEM DESCRIPTION AND INSTALLATION MANUAL

JetWave[™] System

B. Detailed MIB Definition

(1) Object Types

This section describes all the special object types in individual sections and tables, which are not defined in the SNMP and MIB standard.

(a) Link Status Type Definician

The SNMP Type HonAkSatLinkState reports the network link state and link state of the terminal. It is an enumerated integer value with the structure shown in Table B-1.

SNMP Type	Number	Description	
inNetwork	1	In network (service is available)	
inAcquisition	2	In acquisition mode (modem state transition)	
waitingForAcquisition	3	Waiting for acquisition (modem state transition)	
Detected	4	Link detected (modem state transition)	
waiting For Rx Lock	5	Waiting for RX lock (modem state transition)	
rxOnly	6	RX only (modem state transition)	
wrongNetwork	7	Wrong Network accessed	
Unavailable	8	Link status unavailable	
Fault	9	AES is in critical fault mode	
notActive	10	Modem not active yet	
userServiceDisabledRegulatoryLogs	11	User service is disabled due to failure to upload regulatory logs	
		- System will be active only to try and upload the logs	
serviceDisabled 12		Service is disabled – see AKMuteStateReason	

Table B-1. Link Status Related Object

(b) Temporary Service Unavailable Reason Type Definition

The temporary service unavailable reason will be reflected by the type honAkServUnavailReason. It is an enumerated integer value with the structure shown in Table B-2.

SNMP Type	Number	Description
undefined (1)	1	Default state
startingUp (2)	2	System is in Boot state or communication has not established
StartingOp (2)		between LRUs
abortWithSolfBacovany (2)	3	Service unavailable as Cabin attempt to hold services due to
shortWithSelfRecovery (3)		RF blockage, Handover, power interruptions
blockageZone (4)	4	Blockage Zone
indefinite (5)	5	Service unavailable as Crew Muted using TX Control discrete
	6	If landing Terminate any existing services on JetWave™,
onGroundMute(6)		choose an alternative path while on ground, monitor for state
		change, If takeoff, services were never set up
geographicRestrictions (7)	7	Service restricted because of Geographical constraints.
nol inoOfSight(8)	8	Link loss due to antenna in key hole situation, insufficient
noLineOfSight(8)		elevation to the satellite or any other equivalent

Table B-2. Temporary Service Enumeration Types

SYSTEM DESCRIPTION AND INSTALLATION MANUAL

JetWave[™] System

(c) Health Status Type definition

The SNMP type HonAkHealthStatus report the health status of the AES. It is an enumerated integer value with the structure as shown in Table B-3.

Table B-3. Health Status Enumeration Type

SNMP Type	Number	Description
normal	1	The item is OK
warning	2	The item is in WARNING
failed	3	The item has FAILED
Unavailable	4	LRU only, not AES: The LRU health state is not available

(d) Thermal State Definitian

The SNMP Type HonAkThermalState reports the thermal status of the Modman. It is an enumerated integer value with the structure as shown in Table B-4.

Table B-4.	Thermal	State	Enumeration	gavT
	1 normai	olulo	Enamoration	.,

SNMP Type	Number	Description
normal	1	The unit is functioning within its normal operating temperature
normai		range
worning	2	The unit is functioning but outside of its normal operating
warning		temperature range
aritical	3	The unit is critical and may be in shutdown due to operating
critical		outside of its normal operating temperature range

(e) Discrete Input State Type Definition

The SNMP type HonAkDiscreteInputState reports the value of the input discrete. It is an enumerated integer value with the structure as shown in Table B-5.

Table B-5. Discrete Input State Enumeration Type

SNMP Type	Number	Description
Ground	1	Discrete is in the ground state – requirement text indicates
Ground		what ground state means for a particular discrete.
Open	2	Discrete is in the open state.

(f) Discrete Output State Type definition

The SNMP type HonAkDiscreteOutputState reports the value of the output discrete. It is an enumerated integer value with the structure as shown in Table B-6.

Table B-6. Discrete Output State Enumeration Type

SNMP Type	Number	Description
ground	1	Discrete is in the ground state
open	2	Discrete is in the open state.
Fail	3	Failed to set output discrete

23-15-29

SYSTEM DESCRIPTION AND INSTALLATION MANUAL

JetWave[™] System

(g) Tenths Unsigned32 Type definition

The SNMP type HonAkTenthsUnsigned32 cause an Unsigned32 that expresses something in tenths to be displayed in a floating point way.

• For example, consider the case where an object that uses this TC and contains a value of '1234'. This object would be displayed as '123.4'.

(h) Tenths Integer32 Type definition

The SNMP type HonAkTenthsInteger32 cause an Integer32 that expresses something in tenths to be displayed in a floating point way.

• For example, consider the case where an object that uses this TC and contains a value of '-1234'. This object would be displayed as '-123.4'.

(i) IRS Status definition

The SNMP honAkIrsStatus reports the IRS status. It is an enumerated integer value with the structure as shown in Table B-7.

SNMP Type	Number	Description
ok	1	IRS is active and OK
IRS Aligning	2	IRS is in alignment
IRS Inactive	3	IRS is not active and not reporting data

Table B-7. IRS Status Enumeration Type

(j) Mute Reason Type definition

4

IRS Fail

The SNMP honAkTxMutedReason report the reason the terminal has self muted. It is an enumerated integer value with the structure as shown in Table B-8.

IRS has indicated failure

SNMP Type	Number	Description
notMuted(1)	1	Not muted, transmitting
skewAngle(2)	2	Muted because skew angle exceeds regulatory limits
notLocked(3)	3	Not locked
notPointing(4)	4	Not currently pointed
structureBlockage(5)	5	Aircraft structure blockage
onGround(6)	6	On-ground
fault(7)	7	Fault
notReady(8)	8	Not Ready for operation, booting etc
geoRestriction(9)	9	Service is disabled due to Geographic position inside a

restricted region

Table B-8. Mute Reason Enumeration Type

SYSTEM DESCRIPTION AND INSTALLATION MANUAL

JetWave[™] System

(k) Satellite Handover Type definition

The SNMP honAkSatHandoverPending reports the satellite handover state. It is an enumerated integer value with the structure as shown in Table B-9.

Table B-9. Satellite Handover Enumeration Type

SNMP Type	Number	Description
yes	1	Satellite Handover is pending.
no	2	Satellite Handover is not pending
unavailable	3	Satellite Handover information not available

(I) Transmission State on Ground Type Definition

The SNMP honAkServTxOnGround report if transmission on the ground is allowed. It is enabled by discrete input. It is an enumerated integer value with the structure as shown in Table B-10.

Table B-10. Transmission State on Ground Enumeration Type

SNMP Type	Number	Description	
txAllowed	1	RF Transmission is allowed on the ground	
txInhibited	2	RF Transmission is not allowed on the ground	

(m) Port link status Type definition

The SNMP honAkPortInfoOperStatus indicates the current link status of the port. That is, whether the port is currently passing data in either direction within a 10 second trailing window. It is an enumerated integer value with the structure as shown in Table B-11.

Table B-11.	Port Link Status	Enumeration	Types
-------------	------------------	-------------	-------

SNMP Type	Number	Description	
active	1	Port Link Status is active	
inactive	2	Port Link Status is not active	

(2) MIB Object Under Mandatory Branches

-

This section contains various branches detailing what is in each branch and the parameters /meanings.

(a) MIB Version Related Objects

The .honAkVersion (1) folder contains only one object .honAkEngMibVer as shown in the detail below:

Object Identifier	Туре	Range	Description
.honAkEngMibVer (1)	Unsigned32		This object defines the version number of this MIB

(b) Service Related objects

The **.honAkService (2)** folder contains all service relevant information and some configurable parameters that can be set by a client application as follows:

1 Link Status Related Sub Branch

SYSTEM DESCRIPTION AND INSTALLATION MANUAL

JetWave[™] System

The .honAkLinkStatus (1) folder contains object as shown in the details below:

Object Identifier	Туре	Range	Description
.honAkServSatLinkState (1)	HonAkSatLink		This object shows the state of the satellite link.
	State		
.honAkServTxOnGround (2)	honAkServTxO		This object indicates whether RF Transmission is
	nGround		allowed on Ground or not.

2 System Related Sub Branch

The .honAkSystem (2) folder contains objects as shown in the details below:

Object Identifier	Туре	Range	Description
.honAkServSysManufacture (1)	DisplayString	032	ASCII String with up to 32 characters to reports the
			name of the system manufacture.
.honAkServUnavailReason (2)	honAkServUna		The reason the Internet service is not available.
	vailReason		

3 Service Notification configuration Related Sub Branch

The .honAkServTrapsConfig (3) folder contains objects as shown details below:

Object Identifier	Туре	Range	Description
.honAkServTrapsDestlpAddr (1)	IpAddress		The destination IP Address for Service traps.
			If the value of the object is 0.0.0.0, the trap will not
			be sent.
.honAkServTrapsDestPort (2)	Unsigned32	065535	The destination port number for Service traps.
			Default on reset 162.

(c) Maintenance Related objects

The **.honAkMaintenance (3)** folder contains all maintenance relevant information including system health status, interface status, link status, equipment information and some configurable parameters that can be set by a client application.

1 Operation Status Related Sub Branch

The .honAkInstallAndCalibration (1) folder contains objects as shown in the detail below:

Object Identifier	Туре	Range	Description
. honAkInstallNoOae (1)	TruthValue		Default on reset is False, True means operation
			without an OAE operation is allowed

2 System Health Related Sub Branch

The .honAkSystemHealth (2) folder contains objects as shown in the details below:

Object Identifier	Туре	Range	Description
.honAkAesHealthStatus(1)	HonAkHealthStatus		This object reports the health status
			of the AES. It is an enumerated
			integer. Normal during initialization.

SYSTEM DESCRIPTION AND INSTALLATION MANUAL

JetWave[™] System

.honAkModmanHealthStatus(2)	HonAkHealthStatus	This object reports the health status
		of Modman. Normal during
		initialization.
.honAkKanduHealthStatus(3)	HonAkHealthStatus	The health status of the KANDU.
		Unavailable is to be reported when
		the KANDU is not in communication
		with the Modman
.honAkKrfuHealthStatus(4)	HonAkHealthStatus	The health status of the KRFU.
	TionAki lealthotatus	Unavailable is to be reported when
		the KRFU is not in communication
.honAkOaeHealthStatus(5)	HonAkHealthStatus	with the Modman The health status of the OAE.
	TIONARI Tealtinotatus	Unavailable is to be reported when
		•
		the OAE is not in communication
h an Ali Annel La alth Ctatus (C)	HonAkHealthStatus	with the Modman The health status of the APM.
.honAkApmHealthStatus(6)		
.honAkAesFailureCode(7)	DisplayString	Last system failure code. The failure
		code is a 12-digit hexadecimal
		number. When there is no fault, all
		Octets will be set to zero.
.honAkAesFailureText(8)	DisplayString	A textual description of the last
		system failure code
.honAkModmanToKanduEthernet(9)	TruthValue	Report Modman to Kandu Ethernet
		status. True = Okay/Not Available,
		False = Failed
.honAkModmanToKanduTxFilterSelectRs422(10) TruthValue	The Modman to KANDU transmit
		filter select RS422 state. True =
		Okay/Not Available, False = Failed
.honAkModmanToKanduTxKeylineRs422(11)	TruthValue	The Modman to KANDU transmit
		keyline RS422 state. True =
		Okay/Not Available, False = Failed
.honAkKanduToKrfuRs422(12)	TruthValue	The KANDU to KRFU RS422 serial
		data state. True = Okay/Not
		Available, False = Failed
.honAkKrfuToKanduRs422(13)	TruthValue	The KRFU to KANDU RS422 serial
		data state. True = Okay/Not
		Available, False = Failed The KANDU to FMA Ethernet data
.honAkKanduToFmaEthernet(14)	TruthValue	
		state. True = Okay/Not Available,
		False = Failed
.honAkKanduToOaeRs422(15)	TruthValue	The KANDU to OAE RS422 serial
		data state. True = Okay/Not
		Available, False = Failed
.honAkOaeToKanduRs422(16)	TruthValue	The OAE to KANDU RS422 serial
		data state. True = Okay/Not
		Available, False = Failed
.honAkKanduToOaeImuRs422(17)	TruthValue	The KANDU to OAE IMU RS422
		serial data state. True = Okay/Not
		Available, False = Failed
.honAkOaeImuToKanduRs422(18)	TruthValue	The OAE IMU to KANDU RS422
		serial data state. True = Okay/Not
		Available, False = Failed

SYSTEM DESCRIPTION AND INSTALLATION MANUAL

JetWave[™] System

.honAkModmanToKrfuRfLink(19)	TruthValue	The Modman to KRFU RF link state.
		True = Okay/Not Available, False =
		Failed
.honAkKrfuToModmanRfLink(20)	TruthValue	The KRFU to Modman RF link state.
		True = Okay/Not Available, False =
		Failed
.honAkOaeToKrfuRfLink(21)	TruthValue	The OAE RF Link to KRFU state.
		True = Okay/Not Available, False =
		Failed
.honAkApmToModman(22)	TruthValue	The APM to Modman serial data
		state. True = Okay/Not Available,
		False = Failed
.honAkIrsStatus(23)	honAkIrsStatus	This object reports the IRS status.
		IRS inactive is to be reported if the
		KANDU is not in communication
		with the Modman and it is the IRS
		source.
.honAkAesReset(24)	TruthValue	Write = True cause a system reset,
		a write = False causes no action. A
		read always returns false and
		perform no Action.
.honAkModmanThermalState(25)	HonAkThermalStat	the thermal state of the Modman
	e	
.honAkKanduThermalState(26)	HonAkThermalStat	the thermal state of the KANDU
	е	
.honAkKrfuThermalState(27)	HonAkThermalStat	the thermal state of the KRFU
	e	
.honAkOaeThermalState(28)	HonAkThermalStat	the thermal state of the OAE
	e	

<u>3</u> In Service Related Sub Branch

The .honAkInService (3) folder contains objects to supports in-service status and statistics for the maintenance branch of the MIB as shown in the below details:

Object Identifier	Туре	Range	Description
.honAkMaintSatLinkState(1)	HonAkSatLinkState		The state of the satellite link
.honAkTxMuted(2)	TruthValue		Whether or not the terminal has
			muted the satellite transmission. True
			= muted, False = may be transmitting
.honAkTxMutedReason(3)	honAkTxMutedReason		Reason for muting the satellite
			transmission
.honAkSatHandoverPending(4)	honAkSatHandoverPendin		whether a satellite handover is
	g		expected shortly
.honAkLinkStartTime(5)	DateAndTime	RFC2759	Time at which the current satellite was
			established, or 1/1/1970 after a reset
			or if the link is not active
.honAkLinkEndTime(6)	DateAndTime	RFC2759	Time at which the satellite link was
			closed. After a reset and before a
			satellite has been established, the
			value will equate to 1/1/1970.

SYSTEM DESCRIPTION AND INSTALLATION MANUAL

JetWave[™] System

.honAkLinkTxCount(7)	Unsigned32		The total number of kilobytes
			transmitted over the currently active
			satellite link. This object is reset to
			zero when the satellite link is closed
.honAkLinkRxCount(8)	Unsigned32		The total number of kilobytes received
	Cholghoudz		over the currently active satellite link
.honAkLinkSignalQuality(9)	HonAkTenthsUnsigned32		The carrier to noise signal quality in
	· · · · · · · · · · · · · · · · · · ·		tenths of a db/Hz. zero if no signal is
			being received
.honAkLinkSignalLevel(10)	HonAkTenthsInteger32		The Signal level of the satellite link in
	· · · · · · · · · · · · · · · · · · ·		tenths of a dBm. zero if no downlink
			carrier is being received
.honAkLinkEbNoSignalQuality(11)	HonAkTenthsUnsigned32		Calculated satellite link EB/No signal
	rien, ut en lie en eignedez		quality in tenths of a dB
.honAkTxCtrlState(12)	HonAkDiscreteInputState		whether or not satellite transmission
	·····		control analogue input to KANDU is
			enabled
.honAkWowState(13)	HonAkDiscreteInputState		whether or not there is weight on
			wheels
.honAkCellularTxState(14)	HonAkDiscreteInputState		Indicates whether or not cellular
	· · · · · · · · · · · · · · · · · · ·		transmission is enabled
.honAkGroundTxState(15)	HonAkDiscreteInputState		whether or not satellite transmission is
(),			allowed while on the aircraft is ground
.honAkPublicServState(16)	HonAkDiscreteInputState		whether or not Public Service is
			enabled
.honAkCoolingSysAvailState(17)	HonAkDiscreteInputState		whether or not aircraft cooling
			availability is enabled
.honAkRemoteMgrState(18)	HonAkDiscreteInputState		whether or not remote management is
			enabled
.honAkLocalDataLoadState(19)	HonAkDiscreteInputState		whether or not local data loading is
			enabled
.honAkFactoryBenchModeState(20)	HonAkDiscreteInputState		whether or not Factory/Bench Mode is
			enabled
.honAkArincTxMuteState(21)	HonAkDiscreteOutputState		whether or not the ARINC
			transmission is muted
.honAkSysAvailState(22)	HonAkDiscreteOutputState		status of system availability
.honAkDataLinkAvailState(23)	HonAkDiscreteOutputState		status of the data link
.honAkAircraftLatitude(24)	Integer32	-999999	The latitude position of the aircraft in
		-3240003	arc seconds999,999 indicates that
		24000	the data is not available
.honAkAircraftLongitude(25)	Integer32	-999999	The longitude position of the aircraft in
		-6479996	arc seconds999,999 indicates that
		48000	the data is not available.
.honAkAircraftAltitude(26)	Integer32	-999999	The altitude of the aircraft in feet
		-1000010	
		0000	
.honAkAircraftRollAngle(27)	HonAkTenthsInteger32	-999999	The roll angle of the aircraft in tenths
		-900900	of a degree
.honAkAircraftPitchAngle(28)	HonAkTenthsInteger32	-999999	The pitch angle of the aircraft in tenths
		-900900	of a degree
.honAkAircraftTrueHeading(29)	HonAkTenthsUnsigned32	03599	The true heading of the aircraft in
		9999	tenths of a degree. 9,999 indicates
	1		that the data is not available

SYSTEM DESCRIPTION AND INSTALLATION MANUAL

JetWave[™] System

.honAkAircraftOnGround(30)	TruthValue		Indicates whether or not the aircraft is
			on the ground
.honAkAircraftGroundSpeed(31)	Unsigned32	01500	Reports the ground speed of the
		9999	aircraft. The range of the object is
			from 0 to 1,500 knots. 9,999 indicates
			that the data is not available

4 System Configuration Related Sub Branch

The .honAkSystemConfiguration (4) folder contains objects to supports the system configuration for the maintenance branch of the MIB as shown in the below details:

Object Identifier	Туре	Range	Description
.honAkModmanLruName(1)	DisplayString	032	ASCII String with up to 32 characters to show the
			Modman LRU name. Empty if no Standard Electronic
			Information is stored in the Modman.
.honAkModmanOemHwPn(2)	DisplayString	032	ASCII String with up to 32 characters to show Modman
			OEM hardware part number.
.honAkModmanSn(3)	DisplayString	032	ASCII String with up to 32 characters to show Modman
			serial number.
.honAkModmanSwPnSwValid(4)	DisplayString	032	ASCII String with up to 32 characters to show Modman
			software part number and software validity.
.honAkModmanSwSubpartVer(5)	DisplayString	0255	The Modman software sub part version number
.honAkModmanOemId(6)	DisplayString	032	ASCII String with up to 32 characters to show Modman
			OEM identifier.
.honAkModmanHoneywellHwPn(7)	DisplayString	032	ASCII String with up to 32 characters to show Modman
			Honeywell-specific part identifier.
.honAkModmanSubassemblyId(8)	DisplayString	032	ASCII String with up to 32 characters to show Modman
			sub-assembly ID.
.honAkKanduLruName(9)	DisplayString	032	ASCII String with up to 32 characters to show the
			KANDU LRU name. Empty if no Standard Electronic
			Information is stored in the KANDU or the KANDU is not
			attached or powered up.
.honAkKanduOemHwPn(10)	DisplayString	032	ASCII String with up to 32 characters to show KANDU
			OEM hardware part number.
.honAkKanduSn(11)	DisplayString	032	ASCII String with up to 32 characters to show KANDU
			serial number.
.honAkKanduSwPnSwValid(12)	DisplayString	032	ASCII String with up to 32 characters to show KANDU
			software part number and software validity.
.honAkKanduSwSubpartVer(13)	DisplayString	0255	The KANDU software sub part version number
.honAkKanduOemId(14)	DisplayString	032	ASCII String with up to 32 characters to show KANDU
			OEM identifier.
.honAkKanduHoneywellHwPn(15)	DisplayString	032	ASCII String with up to 32 characters to show KANDU
			Honeywell-specific part identifier.
.honAkKanduSubassemblyId(16)	DisplayString	032	ASCII String with up to 32 characters to show KANDU
			sub-assembly ID.
.honAkKrfuLruName(17)	DisplayString	032	ASCII String with up to 32 characters to show the KRFU
			LRU name. Empty if no Standard Electronic Information
			is stored in the KRFU or the KRFU is not attached or
			powered up.
.honAkKrfuOemHwPn(18)	DisplayString	032	ASCII String with up to 32 characters to show KRFU
			OEM hardware part number.
.honAkKrfuSn(19)	DisplayString	032	ASCII String with up to 32 characters to show KRFU
			serial number.

JetWave[™] System

.honAkKrfuSwPnSwValid(20)	DisplayString	032	ASCII String with up to 32 characters to show KRFU
			software part number and software validity.
.honAkKrfuSwSubpartVer(21)	DisplayString	0255	The KRFU software sub part version number
.honAkKrfuOemId(22)	DisplayString	032	ASCII String with up to 32 characters to show KRFU
			OEM identifier.
.honAkKrfuHoneywellHwPn(23)	DisplayString	032	ASCII String with up to 32 characters to show KRFU
			Honeywell-specific part identifier
.honAkOaeLruName(24)	DisplayString	032	ASCII String with up to 32 characters to show the OAE
			LRU name. Empty if no Standard Electronic Information
			is stored in the OAE or the OAE is not attached or
			powered up.
.honAkOaeOemHwPn(25)	DisplayString	032	ASCII String with up to 32 characters to show OAE OEM
	Diopiayounig	002	hardware part number.
.honAkOaeSn(26)	DisplayString	032	ASCII String with up to 32 characters to show OAE
	DisplayOtting	002	serial number.
.honAkOaeSwPnSwValid(27)	DisplayString	032	ASCII String with up to 32 characters to show OAE
	DisplayOthing	052	software part number and software validity.
.honAkOaeSwSubpartVer(28)	DisplayString	0255	The OAE software sub part version number. Empty if the
.nonAkOaeSwSubpartver(28)	DisplayString	0200	
.honAkOaeOemId(29)	DisplayString	032	OAE is not attached or powered up ASCII String with up to 32 characters to show OAE OEM
.nonAkOaeOemid(29)	DisplayString	032	
.honAkOaeHoneywellHwPn(30)	DisplayString	032	identifier. ASCII String with up to 32 characters to show OAE
.nonAkOaenoneyweiinwPh(30)	DisplayString	032	
	Dian la contrin a	0.00	Honeywell-specific part identifier.
.honAkOaeSubassemblyId(31)	DisplayString	032	ASCII String with up to 32 characters to show OAE
			sub-assembly ID. Empty if the OAE is not attached or
			powered up
.honAkApmLruName(32)	DisplayString	032	ASCII String with up to 32 characters to show the APM
			LRU name. Empty if no Standard Electronic Information
			is stored in the APM or the APM is not attached.
.honAkApmOemHwPn(33)	DisplayString	032	ASCII String with up to 32 characters to show APM
			OEM hardware part number.
.honAkApmSn(34)	DisplayString	032	ASCII String with up to 32 characters to show APM
			serial number.
.honAkApmOemId(35)	DisplayString	032	ASCII String with up to 32 characters to show APM
			OEM identifier.
.honAkAircraftTailNbr(36)	DisplayString	032	ASCII String with up to 32 characters to show aircraft tail
· · ·			number
.honAkCfgInfo(37)	DisplayString	0255	ASCII String to show overall configuration data part
5,			numbers and CRCs
.honAkGeoRestriction(38)	DisplayString	0255	ASCII String to show state of the geographic restriction

5 Network Configuration Related Sub Branch

The .honAkNetworkConfiguration(5) folder contains the following:

a Port info Number

The **.honAkPortInfoNumber (1)** object report the number of supported Ethernet ports. Nominal is 14.

23-15-29

Page B-11 16 Sep 2015

SYSTEM DESCRIPTION AND INSTALLATION MANUAL JetWave™ System

b Port Info Table

The **.honAkPortInfoTable (2)** table supports information pertaining to various Ethernet ports. This table has objects as shown in the below detail:

Object Identifier	Туре	Range	Description
.honAkPortInfoIndex(1)	Unsigned32	14294	The index for an entry that
	_	967295	represents a particular Ethernet
			port.
.honAkPortInfoName(2)	DisplayString	016	ASCII string with up to 16
			characters to show the name of
			the port
.honAkPortInfoUserDataSupported(3)	TruthValue		whether or not the port is
			configured for user data
			operation
.honAkPortInfoOperStatus(4)	honAkPortInfoOperStatu		report the port link status (active
	s .		if the port is passing data in either
			direction in the last 10 seconds)
.honAkPortInfoVlanIdList(5)	DisplayString	0255	Report list of VLAN IDs currently
	-1		assigned to the port. Empty string
			indicates no VLAN IDs assigned
			to this port.
.honAkPortInfoDataLoadSupported(6)	TruthValue		Report whether or not data load
			is supported
.honAkPortInfoArinc791SnmpSupported(7)	TruthValue		Report whether or not ARINC
			791 SNMP is supported
.honAkPortInfoMaintSnmpSupported(8)	TruthValue		Whether or not
······································			maintenance/engineering SNMP
			is supported
.honAkPortInfoMagic839Supported(9)	TruthValue		Report whether or not MAGIC
			839 client is supported
.honAkPortInfoAesAccessServSupported(10)	TruthValue		Whether or not AES-level access
			services are supported
.honAkPortInfoLruAccessServSupported(11)	TruthValue		whether or not LRU-level access
			services are supported
.honAkPortInfoGuiSupported(12)	TruthValue	1	Report whether or not the GUI is
			supported
.honAkPortInfoDevelServSupported(13)	TruthValue	1	Report whether or not
			development services are
			supported

6 Maintenance Traps Configuration Related Sub Branch

The .honAkMaintTrapsConfig(6) folder contain objects as shown in the below details:

Object Identifier	Туре	Range	Description
honAkMaintTrapsDestIpAddr	IpAddress	RFC	This object to configure the IP address that maintenance
(1)		2578	notification traps are sent to and if they are enabled (0.0.0.0
			means do not send traps and is the default after reset), as
			an IPAddress (RFC 2578) value
honAkMaintTrapsDestPort (2)	Unsigned32	0 -	This object configure which IP port traps are addressed to
		65535	(0-65535, default on reset 162), as an Unsigned32 value

SYSTEM DESCRIPTION AND INSTALLATION MANUAL

JetWave[™] System

(3) Traps under Engineering Notification Branch

This **honAkEngNotifications(3)** branch contain service and maintenance notification's folder for maintenance and service related traps.

(a) Service Trap Related Sub Branch

The .honAkServTrap(0)Branch contains the object as shown in the below details:

Trap (OID)	Monitored Objects	Description
.honAkServLinkStateChgTrap (1)	honAkServSatLinkState	This trap has to be sent, when the value of the link
		state of terminal object changes

(b) Maintenance Trap related sub branch

The .honAkMaintTrap(0) branch contains the objects as shown in the below details:

Trap (OID)	Monitored Objects	Description
.honAkMaintLinkStateChgTrap (1)	honAkMaintSatLinkSt	This trap has to be sent, if satellite link changes
	atus	
.honAkMaintTxMuteChgTrap (2)	honAkTxMutedReaso	This trap has to be sent, if transmit mute reason
	n	changes
.honAkMaintSysAvailChgTrap (3)	honAkSysAvailState	This trap has to be sent if system availability
		changes
.honAkMaintDataLinkAvailChgTrap (4)	honAkDataLinkAvailS	This trap has to be sent, if the data link availability
	tate	changes
.honAkMaintAesHealthStatusChgTrap	honAkAesHealthStatu	This trap has to be sent, if the AES health status
(5)	S	changes.

B. Modman	Physical	Examine for physical damage.			
		Environmental conditions, refer to Figure 2-24.			
	Mounting tray	Install applicable 4-MCU tray, supplied by customer.			
	Clearance	Minimum 1 inch (25.4 mm) from top surface and 0.5 inch (12.7 mm) from all other surfaces			
	Electrical connector	ARINC 600 mating connector and pins, refer to Table 2-1. ARINC 600 Connectors			
		ARINC 600 polarized pins			
	Electrical bonding	Bonding, refer to page 2-5.			
	Electrical wiring	Electrically wire and interconnect in accordance with Figure 2-24 and Figure 2-33.			
	Electrical RF coaxial	Equalizer in the TX path TX path loss, refer to Table 2-2. Modman			
		Cable Loss Values			
		Attenuator in the RX path			
		RX path loss, refer to Table 2-2. Modman Cable Loss Values			
C. APM	Physical	Examine for physical damage.			
		Environmental conditions, refer to Figure 2-25			
	Mounting	Can be installed in any orientation, refer to Figure 2-25.			
		Use 0.164-32 UNC-2A corrosion resistant mounting fasteners. Do not exceed 25 in-lb (2.8 Nm) when you torque the screws.			
	Electrical bonding	Electrically bond in accordance with page 2-6.			

SYSTEM DESCRIPTION AND INSTALLATION MANUAL

JetWave[™] System

Section	Parameter	Item	NA	 Value
C. APM (Cont)	Electrical wiring	Electrically wire and interconnect in accordance with Figure 2-25 and Figure 2-33.		
	Electrical wiring - APM to Modman	Connect the APM to the Modman with two twisted shielded 24 AWG pairs with Teflon insulation or aerospace grade shielded CAT5/CAT5e cable, maximum length 9.8 feet (3 m).		
D. KANDU	Physical	Examine for physical damage.		
		Environmental conditions, refer to Figure 2-26		
	Electrical wiring	Electrically wire and interconnect in accordance with Figure 2-26 and Figure 2-33.		
	Mounting	Install location of KANDU is airframe specific. KANDU could be installed in unpressurized area near the tail empennage of the aircraft or inside pressurized area of the aircraft. In case of KANDU install location is inside pressurized location, the KANDU to KRFU and KANDU to TMA interconnect may be routed through a Bulkhead Interface connector.		
	Electrical wiring - KANDU to TMA	Refer to JetWave™ System LRU Installation, KANDU on page 2-6.		
	Electrical wiring - KANDU bulkhead interface	Refer to JetWave™ System LRU Installation, KANDU on page 2-6.

JetWave™ System

Section	Parameter	Item	NA	\checkmark	Value
E. KRFU	Physical	Examine for physical damage.			
		Environmental conditions, refer to Figure 2-27, Figure 2-28, or Figure 2-29 depending on configuration used.			
		Install the thermal pad in accordance with KRFU Thermal Pad Kit on page 2-9.			
		The KRFU is installed with the TMA, refer to OAE TMA Installation Procedure on page 2-15.			
		The KRFU feet are configured differently depending on the part number ordered. Make sure feet are in the correct configuration for the aircraft application.			
	Waveguide	Make sure the waveguide is connected before powering the KRFU.			
	Waveguide - KRFU to TMA	Connection must be WR28 for TX and coaxial cable for RX.			
		The TX interconnect path loss			
		The RX interconnect path loss			
		RX connection at the KRFU requires a WR42 to coax transition adapter at the KRFU J4			
	Electrical wiring	Electrically wire and interconnect in accordance with outline drawing Figure 2-27, Figure 2-28, or Figure 2-29 and interconnect drawing Figure 2-33.			
	Electrical bonding	Electrically bond in accordance with page 2-9.			
J. OAE TMA Installation Procedure	Physical	Refer to OAE TMA Installation Procedure.			
	TMA mounting	Refer to OAE TMA Installation Procedure.			
	TMA interface mount brackets	Refer to OAE TMA Installation Procedure.			

SYSTEM DESCRIPTION AND INSTALLATION MANUAL JetWave™ System

Section	Parameter	Item	NA	\checkmark	Value
J. OAE TMA Installation Procedure (Cont)	TMA install	Refer to JetWave™ System LRU Installation, OAE TMA Installation Procedure.			
	TMA radome and radome fairing	Depending on the airframe, there may be a need to install radome fairing which adapts to the tail empennage of the aircraft, consult aircraft OEM.			
		Radome and fairing installation is aircraft specific. Refer to aircraft specific SDIM for details. <u>NOTE:</u> Before removing the Tail Mount Radome, Honeywell recommends manually steering the TMA to a safe antenna orientation position using the JetWave [™] GUI. The TMA parking position is included in the AES System Configuration File, which can be accessed through the GUI web interface and by navigating to Configuration File page. Consult aircraft specific SDIM for detailed instructions.			
	TMA bonding	Electrically bond in accordance with page 2-15.			
	TMA alignment	Automatic alignment, manual alignment, or command, refer to TMA Alignment on page 2-20 and TMA and FMA Antenna Alignment Procedure on page 2-36

Section	Parameter	Item	NA	\checkmark	Value
B. Modman (Cont)	Clearance	Minimum 1 inch (25.4 mm) from top surface and 0.5 inch (12.7 mm) from all other surfaces			
	Electrical connector	ARINC 600 mating connector and pins, refer to Table 2-1. ARINC 600 Connectors			
		ARINC 600 polarized pins			
	Electrical bonding	Bonding, refer to page 2-5			
	Electrical wiring	Electrically wire and interconnect in accordance with Figure 2-24 and Figure 2-34, Figure 2-35, or Figure 2-36.			
	Electrical RF	Equalizer in the TX path			
		TX path loss, refer to Table 2-2. Modman Cable Loss Values			
		Attenuator in the RX path			
		RX path loss, refer to Table 2-2. Modman Cable Loss Values			
C. APM	Physical	Examine for physical damage.			
		Environmental conditions, refer to Figure 2-25			
	Mounting	Can be installed in any orientation. Refer to Figure 2-25.			
		Use 0.164-32 UNC-2A corrosion resistant mounting fasteners. Do not exceed 25 in-lb (2.8 Nm) when you torque the screws.			
	Electrical bonding	Electrically bond in accordance with page 2-6.			
	Electrical wiring	Electrically wire and interconnect in accordance with Figure 2-25 and Figure 2-34, Figure 2-35, or Figure 2-36.			

23-15-29

SYSTEM DESCRIPTION AND INSTALLATION MANUAL

JetWave™ System

Section	Parameter	ltem	NA	\checkmark	Value
C. APM (Cont)	Electrical wiring - APM to Modman	Connect the APM to the Modman with two twisted shielded 24 AWG pairs with Teflon insulation or aerospace grade shielded CAT5/CAT5e cable, maximum length 9.8 feet (3 m).			
D. KANDU	Physical	Examine for physical damage.			
		Environmental conditions, refer to Figure 2-26			
	Mounting	Install location of KANDU is airframe specific. The KANDU is installed inside a pressurized location, the KANDU to KRFU and KANDU to FMA interconnect are routed through a Bulkhead Interface connectors.			
	Electrical Wiring KANDU-FMA	Refer to JetWave™ System LRU Installation, KANDU on page 2-6.			
E. KRFU	Physical	Examine for physical damage.			
		Environmental conditions, refer to Figure 2-27, Figure 2-28, or Figure 2-29 depending on configuration used.			
		Install the thermal pad in accordance with KRFU Thermal Pad Kit on page 2-9.			
		The KRFU is installed with the FMA, refer to FMA Installation Procedure on page 2-29.			
		The KRFU feet are configured differently depending on the part number ordered. Make sure feet are in the correct configuration for the aircraft application.			
	Waveguide	Make sure the waveguide is connected before powering the KRFU.			
	Waveguide - KRFU to FMA	Connection must be WR28 for TX and coaxial cable for RX.			
		The TX interconnect path loss			

SYSTEM DESCRIPTION AND INSTALLATION MANUAL

JetWave[™] System

Section	Parameter	Item	NA	\checkmark	Value
E. KRFU (Cont)	Waveguide - KRFU to FMA	The RX interconnect path loss			
	(Cont)	RX connection at the KRFU requires a WR42 to coax transition adapter at the KRFU J4.			
	Electrical wiring	Electrically wire and interconnect in accordance with outline drawing Figure 2-27, Figure 2-28, or Figure 2-29 and interconnect drawing Figure 2-34, Figure 2-35, or Figure 2-36.			
	Electrical bonding	Electrically bond in accordance with page 2-9.			
N. FMA Installation Procedure	Physical	Examine the FMA AIM for physical damage.			
		Examine the FMA assembly for physical damage.			
		Examine the radome for physical damage. Refer to Figure 2-32.			
		Environmental conditions, refer to Figure 2-31			
	Positioning	The aircraft fuselage mount OAE must be mounted on the top of the fuselage.			
	FMA AIM	Refer to Fuselage Mount Antenna (8).			
	FMA Install	Refer to Fuselage Mount Antenna (8).			
		Attach the radome assembly onto the AIM.			
	•	Electrically bond in accordance with page 2-29.			
		Automatic alignment, manual alignment, or command, refer to FMA Alignment on page 2-35 and TMA and FMA Antenna Alignment Procedure on page 2-36.			

C. Non-A791 Based OAE-FMA with the LAIM Checklist

SYSTEM DESCRIPTION AND INSTALLATION MANUAL JetWave™ System

Section	Parameter	ltem	NA	\checkmark	Value
A. Maintenance Panel	Applicability	If the system is not wired to another aircraft system, a maintenance panel is required.			
	Discrete output connections	System available (Modman MP13E) connected to a lamp			
		Data link available (Modman MP13F) connected to a lamp			
	Discrete input connections	Local data load enable (Modman MP10B) connected to a normally open switch			
		Ground transmit enable (Modman MP11D) connected to a normally open switch			
		Public service disable (Modman MP11E) connected to a normally open switch			
		Modman reset (Modman MP10C) connected to a normally open switch			
	Ethernet port connections	AV1 (Modman TP BB1 thru 4) connected to a RJ45 Ethernet connector			
	Additional electrical wiring	Electrically wire and interconnect in accordance with Figure 2-33.			
B. Modman	Physical	Examine for physical damage.			
		Environmental conditions, refer to Figure 2-24			
	Mounting tray	Install applicable 4-MCU tray, supplied by customer.			
	Clearance	Minimum 1 inch (25.4 mm) from top surface and 0.5 inch (12.7 mm) from all other surfaces			
	Electrical connector	ARINC 600 mating connector and pins, refer to Table 2-1. ARINC 600 Connectors			
		ARINC 600 polarized pins			

SYSTEM DESCRIPTION AND INSTALLATION MANUAL

Section Parameter Item		Item	NA	 Value
B. Modman (Cont)	Electrical bonding	Bonding, refer to page 2-5		
	Electrical wiring	Electrically wire and interconnect in accordance with Figure 2-24 and Figure 2-34, Figure 2-35, or Figure 2-36.		
	Electrical RF coaxial	Equalizer in the TX path TX path loss, refer to Table 2-2. Modman Cable Loss Values		
		Attenuator in the RX path RX path loss, refer to Table 2-2. Modman Cable Loss Values		
C. APM	Physical	Examine for physical damage. Environmental conditions, refer to Figure 2-25		
	Mounting	Can be installed in any orientation. Refer to Figure 2-25.		
		Use 0.164-32 UNC-2A corrosion resistant mounting fasteners. Do not exceed 25 in-lb (2.8 Nm) when you torque the screws.		
	Electrical bonding	Electrically bond in accordance with page 2-6.

D. KANDU	Physical	Examine for physical damage.			
		Environmental conditions, refer to Figure 2-26			
	Electrical wiring	Electrically wire and interconnect in accordance with Figure 2-26 and Figure 2-34, Figure 2-35, or Figure 2-36.			
	Mounting	Install location of KANDU is airframe specific. The KANDU is installed inside a pressurized location, the KANDU to KRFU and KANDU to FMA interconnect are routed through a Bulkhead Interface connectors.			
	Electrical wiring - KANDU -FMA	Refer to KANDU (1).			
	Electrical bonding	Electrically bond in accordance with page 2-7.			
		KANDU bonding to the aircraft must be achieved through the mounting structure (fasteners) and KANDU A3J1-A.			
		The bulkhead interface connectors should be electrically bonded to the aircraft.			
E. KRFU	Physical	Examine for physical damage.		-	
		Environmental conditions, refer to Figure 2-27, Figure 2-28, or Figure 2-29 depending on configuration used.			
		Install the thermal pad in accordance with KRFU Thermal Pad Kit on page 2-9.			
		The KRFU is installed with the FMA. refer to FMA Installation Procedure on page 2-29.

Airframe Structural Blockage Information					
Blockage Angle	Value in Degrees	Remarks			
Blockage Angle a		Angle "a" is the angle between the horizontal plane where the antenna emitting point is located and outer tip of the Horizontal Tail Plane (HTP).			
Blockage Angle b		Angle "b" is between horizontal plane where antenna emitting point is located and outer tip of wing (including vortex eliminators, if present).			

SYSTEM DESCRIPTION AND INSTALLATION MANUAL

JetWave[™] System

Blockage Angle c	Angle "c" refers to the point of the wing, where an
	antenna radiating at -10 degrees elevation would
	find the wing's leading edge.
Blockage Angle d	Angle "d" refers to the outer, aft-most tip of the
	wing (including vortex eliminators, if present).
Blockage Angle e	Angle "e" provides the azimuth range of the
	Vertical Tail Plane (VTP) region of blockage in its
	broadest case.
Blockage Angle f	Angle "f" is between the fuselage centerline and
	the outer, forward-most tip of the HTP.
Blockage Angle h	Angle "h" provides the Vertical Tail Plane (VTP)
	region of blockage in elevation from -10 degrees
	up.
Blockage Angle i	Angle "i" is between the horizontal plane where
	the antenna emitting point is located and upper,
	forward-most part of the fuselage.
Blockage Angle k	Angle "k" is the angle between the horizontal
	plane where the antenna emitting point is located
	and the aft-most tip of the HTP.
Blockage Angle m	Angle "m" is between the horizontal plane where
	the antenna emitting point is located and the HTP
	leading edge root (forward-most joint to fuselage).
Blockage Angle p	Angle "p" is from the emitter point to upper,
	aft-most wing tip (including vortex eliminators, if
	present).

NOTE:

- All zenith view (from above) angles, except for "e," are measured from the aircraft longitudinal axis, being 0 degrees at the stern.
- All side view angles are measured from the aircraft longitudinal axis, being 0 degrees at the plane where the antenna emitter is located.
- Refer to ARINC Characteristic 791 Mark I Aviation Ku-band and Ka-Band Satellite Communication System, Part 1- Physical Installation and Aircraft Interfaces for Aircraft blockage map parameters.
