

7.5.2 LAN Networks

In this page you can create extra LAN networks, and assign them with LAN Ports and wireless access points. You can get extra information on how to configure any of your LAN's settings in section – 7.3 LAN

LAN

LAN Networks List

LAN name	Interface name	
Lan	eth0 tap0	<button>Edit</button>

LAN name: Add New

	Field Name	Sample Value	Explanation
1.	LAN name	Lan	Specifies new LAN name
2.	Interface name	eth0 tap0	Specifies LAN interface name

7.6 Firewall

In this section we will look over the various firewall features that come with RUT9.

7.6.1 General Settings

The routers firewall is a standard Linux iptables package, which uses routing chains and policies to facilitate control over inbound and outbound traffic.

General Settings **Port Forwarding** **Traffic Rules** **Custom Rules** **DDOS Prevention**

Firewall

General settings allows you to set up default firewall policy.

General Settings

Drop invalid packets ☐

Input

Output

Forward

	Field Name	Sample value	Explanation
1.	Drop Invalid	Checked/Unchecked	A “Drop” action is performed on a packet that is determined to be invalid

	packets		
2.	Input	Reject/Drop/Accept	DEFAULT* action that is to be performed for packets that pass through the Input chain.
3.	Output	Reject/Drop/Accept	DEFAULT* action that is to be performed for packets that pass through the Output chain.
4.	Forward	Reject/Drop/Accept	DEFAULT* action that is to be performed for packets that pass through the Forward chain.

*DEFAULT: When a packet goes through a firewall chain it is matched against all the rules for that specific chain. If no rule matches said packet, an according Action (either Drop or Reject or Accept) is performed.

Accept – Packet gets to continue down the next chain.

Drop – Packet is stopped and deleted.

Reject – Packet is stopped, deleted and, differently from Drop, an ICMP packet containing a message of rejection is sent to the **source** of the dropped packet.

7.6.2 DMZ

DMZ Configuration

Enable ☐

DMZ host IP address

By enabling DMZ for a specific internal host (for e.g.: your computer), you will expose that host and its services to the routers WAN network (i.e. - internet).

7.6.3 Port Forwarding

Here you can define your own port forwarding rules.

Firewall - Port Forwarding

Port forwarding allows remote computers on the Internet to connect to a specific computer or service within the private LAN.

Port Forwarding Rules						
Name	Protocol	Source	Via	Destination	Enable	Sort
Enable_SSH_WAN_PASSTHROUGH	TCP	From any host in wan	To any router IP at port 22	Forward to IP 127.0.0.1, port 22 in lan	☐	Edit Delete
Enable_HTTP_WAN_PASSTHROUGH	TCP	From any host in wan	To any router IP at port 80	Forward to IP 127.0.0.1, port 80 in lan	☐	Edit Delete
Enable_HTTPS_WAN_PASSTHROUGH	TCP	From any host in wan	To any router IP at port 443	Forward to IP 127.0.0.1, port 443 in lan	☐	Edit Delete
Enable_CLI_WAN_PASSTHROUGH	TCP	From any host in wan	To any router IP at port 4200	Forward to IP 127.0.0.1, port 4200 in lan	☐	Edit Delete

New Port Forward Rule				
Name	Protocol	External port (s)	Internal IP	Internal port (s)
Enable_Test_Rule	TCP+UDP v	12345	192.168.1.109 v	12345
				Add

You can use port forwarding to set up servers and services on local LAN machines. The above picture shows how you can set up a rule that would allow a website that is being hosted on 192.168.1.109, to be reached from the outside by entering `http://routersExternalIp:12345/`.

	Field Name	Sample value	Explanation
1.	Name	Enable_SSH_WAN_PASSTHROUGH	Name of the rule. Used purely to make it easier to manage rules.
2.	Protocol	TCP/UDP/TCP+UDP/Other	Type of protocol of incoming packet.
3.	External Port	1-65535	From this port on the WAN network the traffic will be forwarded.
4.	Internal IP address	IP address of some computer on your LAN	The IP address of the internal machine that hosts some service that we want to access from the outside.
5.	Internal port	1-65535	To that port on the internal machine the rule will redirect the traffic.

When you click **edit** you can fine tune a rule to near perfection, if you should desire that.

This page allows you to change advanced properties of the port forwarding entry. Although, in most cases there is no need to modify those settings.

Internal IP address

Internal port

Enable NAT loopback ☐

Extra arguments

	Field Name	Sample value	Explanation
1.	Name	ENABLE_SSH_WAN_PASSTHROUGH	Name of the rule. Used purely to make it easier to manage rules.
2.	Protocol	TCP/UDP/TCP+ UDP/ICMP/Custom	You may specify multiple by selecting (custom) and then entering protocols separated by space
3.	Source zone	LAN/VPN/WAN	Match incoming traffic from this zone only
4.	Source MAC address	any	Match incoming traffic from these MACs only
5.	Source IP address	any	Match incoming traffic from this IP or range only
7.	Source port	any	Match incoming traffic originating from the given source port or port range on the client host only
8.	External IP address	any	Match incoming traffic directed at the given IP address only
9.	External port	22	Match incoming traffic directed at the given destination port or port range on this host only
10.	Internal zone	LAN/VPN/WAN	Redirect matched incoming traffic to the specified internal zone
11.	Internal IP address	127.0.0.1	Redirect matched incoming traffic to the specified internal host
12.	Internal port	any	Redirect matched incoming traffic to the given port on the internal host
13.	Enable NAT loopback	Enable/Disable	NAT loopback enables your local network (i.e. behind your router/modem) to connect to a forward-facing IP address (such as 208.112.93.73) of a machine that it also on your local network
14.	Extra arguments		Passes additional arguments to iptables. Use with care!

7.6.4 Traffic Rules

The traffic rule page contains a more generalized rule definition. With it you can block or open ports, alter how traffic is forwarded between LAN and WAN and many more things.

General Settings

Port Forwarding

Traffic Rules

Custom Rules

DDOS Prevention

Firewall - Traffic Rules

Traffic rules define policies for packets traveling between different zones, for example to reject traffic between certain hosts or to open WAN ports on the router.

Traffic Rules						
Name	Protocol	Source	Destination	Action	Enable	Sort
Allow-DHCP-Relay	UDP	From any host in wan	To any router IP at port 67 on this device	Accept input	☐	↑ ↓ Edit Delete
Allow-DHCP-Renew	UDP	From any host in wan	To any router IP at port 68 on this device	Accept input	☒	↑ ↓ Edit Delete
Allow-Ping	ICMP with type echo-request	From any host in wan	To any router IP on this device	Accept input	☒	↑ ↓ Edit Delete

	Field Name	Explanation
1.	Name	Name of the rule. Used for easier rules management purpose only
2.	Protocol	Protocol type of incoming or outgoing packet
3.	Source	Match incoming traffic from this IP or range only
4.	Destination	Redirect matched traffic to the given IP address and destination port
5.	Action	Action to be taken for the packet if it matches the rule
6.	Enable	Self-explanatory. Uncheck to make the rule inactive. The rule will not be deleted, but it also will not be loaded into the firewall.
7.	Sort	When a packet arrives, it gets checked for a matching rule. If there are several rules that match the rule, the first one is applied i.e. the order of the rule list impacts how your firewall operates, therefore you are given the ability to sort your list as you wish.

You can configure firewall rule by clicking **edit** button.

This page allows you to change advanced properties of the traffic rule entry, such as matched source and destination hosts.

Extra arguments

	Field Name	Sample value	Explanation
1.	Name	"Allow-DHCP-Relay"	Used to make rule management easier
2.	Restrict to address family	IPv4 and IPV6	Match traffic from selected address family only
3.	Protocol	TCP/UDP/Any/ICMP/Custom	Protocol of the packet that is being matched against traffic rules.
4.	Match ICMP type	any	Match traffic with selected ICMP type only
5.	Source zone	any zone/LAN/VPN/WAN	Match incoming traffic from this zone only
6.	Source MAC address	any	Match incoming traffic from these MACs only
7.	Source address	any	Match incoming traffic from this IP or range only
8.	Source port	any	Match incoming traffic originating from the given source port or port range on the client host only
9.	Destination zone	Device/Any zone/LAN/VPN/WAN	Match forwarded traffic to the given destination zone only
10.	Destination address	any	Match forwarded traffic to the given destination IP address or IP range only
11.	Destination port	67	Match forwarded traffic to the given destination port or port range only
12.	Action	Drop/Accept/Reject + chain + additional rules	Action to be taken on the packet if it matches the rule. You can also define additional options like limiting packet volume, and defining to which chain the rule belongs

7.6.4.1 Open Ports On the Router

Open Ports On Router

Name	Protocol	External port	
Open_Port_rule	TCP v	22	Add

	Field Name	Sample value	Explanation
1.	Name	Open_Port_rule	Used to make rule management easier
2.	Protocol	TCP/UDP/Any/ICMP/Custom	Protocol of the packet that is being matched against traffic rules.
3.	External port	1-65535	Match incoming traffic directed at the given destination port or port range on this host.

7.6.4.2 New Forward Rule

New Forward Rule

Name	Source	Destination	
Forward rule new	LAN v	WAN v	Add

	Field Name	Sample value	Explanation
1.	Name	Forward rule new	Used to make rule management easier
2.	Source	LAN/VPN/WAN	Match incoming traffic from selected address family only
3.	Protocol	TCP/UDP/Any/ICMP/Custom	Protocol of the packet that is being matched against traffic rules.

7.6.4.3 Source NAT

Source NAT is a specific form of masquerading which allows fine grained control over the source IP used for outgoing traffic, for example to map multiple WAN addresses to internal subnets.

Source NAT
Source NAT is a specific form of masquerading which allows fine grained control over the source IP used for outgoing traffic, for example to map multiple WAN addresses to internal subnets.

Name	Protocol	Source	Destination	SNAT	Enable

10.	SNAT IP address	"10.101.1.10"	Rewrite matched traffic to the given IP address
11.	SNAT port	"22"	Rewrite matched traffic to the given source port. May be left empty to only rewrite the IP address'
12.	Extra arguments		Passes additional arguments to iptables. Use with care!

7.6.5 Custom Rules

Here you have the ultimate freedom in defining your rules – you can enter them straight into the iptables program. Just type them out into the text field and it will get executed as a Linux shell script. If you are unsure of how to use iptables, check out the internet for manuals, examples and explanations.

General Settings
Port Forwarding
Traffic Rules
Custom Rules
DDOS Prevention
Port Scan Prevention

Firewall - Custom Rules

Custom rules allow you to execute arbitrary iptables commands which are not otherwise covered by the firewall framework. The commands are executed after each firewall restart, right after the default ruleset has been loaded.

```
# This file is interpreted as shell script.
# Put your custom iptables rules here, they will
# be executed with each firewall (re-)start.

# Internal uci firewall chains are flushed and recreated on reload, so
# put custom rules into the root chains e.g. INPUT or FORWARD or into the
# special user chains, e.g. input_wan_rule or postrouting_lan_rule.
```

7.6.6 DDOS Prevention

7.6.6.1 SYN Flood Protection

SYN Flood Protection allows you to protect from attack that exploits part of the normal TCP three-way handshake to consume resources on the targeted server and render it unresponsive. Essentially, with SYN flood DDoS, the offender sends TCP connection requests faster than the targeted machine can process them, causing network saturation.

3.	Limit	"10"	Maximum SSH connections during the period
4.	Limit burst	"5"	Indicating the maximum burst before the above limit kicks in.

7.6.6.4 HTTP Attack Prevention

HTTP attack sends a complete, legitimate HTTP header, which includes a 'Content-Length' field to specify the size of the message body to follow. However, the attacker then proceeds to send the actual message body at an extremely slow rate (e.g. 1 byte/110 seconds). Due to the entire message being correct and complete, the target server will attempt to obey the 'Content-Length' field in the header, and wait for the entire body of the message to be transmitted, hence slowing it down.

4.	FIN scan	Protect from FIN scan
5.	NULLflags attack	Protect from NULLflags attack

7.7 Routing

7.7.1 Static Routes

Static routes specify over which interface and gateway a certain host or network can be reached.

Static Routes
Dynamic Routes

Static Routes

Routes specify over which interface and gateway a certain host or network can be reached.

Static IP Routes

Routing table	Interface	Destination address	Netmask	Gateway	Metric	
WAN	WAN (Mobile)	0.0.0.0	0.0.0.0		0	Delete
WAN2	WAN2 (Wired)	0.0.0.0	0.0.0.0		0	Delete
WAN3	WAN3 (WiFi)	0.0.0.0	0.0.0.0		0	Delete

Add

Save

	Field name	Value	Explanation
1.	Routing table	MAIN/WAN/WAN2/WAN3	Defines the table to use for the route
2.	Interface	MAIN/WAN/WAN2/WAN3	The zone where the target network resides
3.	Destination address	IP address	The address of the destination network
4.	Netmask	IP mask	Mask that is applied to the Target to determine to what actual IP addresses the routing rule applies
5.	Gateway	IP address	To where the router should send all the traffic that applies to the rule
6.	Metric	integer	Used as a sorting measure. If a packet about to be routed fits two rules, the one with the higher metric is applied.

Additional note on Target & Netmask: You can define a rule that applies to a single IP like this: Target - some IP; Netmask - 255.255.255.255. Furthermore you can define a rule that applies to a segment of IPs like this: Target – some IP that STARTS the segment; Netmask – Netmask that defines how large the segment is. E.g.:

192.168.55.161	255.255.255.255	Only applies to 192.168.55.161
192.168.55.0	255.255.255.0	Applies to IPs in range 192.168.55.0-192.168.55.255
192.168.55.240	255.255.255.240	Applies 192.168.55.240 - 192.168.55.255
192.168.55.161	255.255.255.0	192.168.55.0 - 192.168.55.255
192.168.0.0	255.255.0.0	192.168.0.0 - 192.168.255.255

7.7.2 Dynamic Routes

7.7.2.1 General

Dynamic routes provide dynamic routing which enables router to select paths according to real-time logical network layout changes.

1.	Prefix	Protocol prefix of incoming or outgoing packet
2.	Type	Protocol type of incoming or outgoing packet

7.8 Load Balancing

Load balancing lets users divide traffic between different interfaces.

The screenshot shows the 'Load Balancing Configuration' page in the Teltonika web interface. The top navigation bar includes 'Status', 'Network', 'Services', 'System', and a 'Logout' button. The page title is 'Load Balancing Configuration'. Below the title, there is a 'Policies' section with a table showing the 'balanced' policy. The table has columns for 'Policy', 'Members assigned', 'Ratio', and 'Sort'. The 'balanced' policy is assigned to 'Mobile' and 'Wired' with a ratio of 3 to 2. There are 'Edit' and 'Delete' buttons for this policy. Below the table, there is an 'Add' button. Underneath, there is a 'Rule' section with a table showing the 'default_rule'. The table has columns for 'Rule', 'Source address', 'Source port', 'Destination address', 'Destination port', 'Protocol', 'Policy assigned', and 'Sort'. The 'default_rule' has a source address of '0.0.0.0/0', a destination address of '0.0.0.0/0', and is assigned to the 'balanced' policy. There are 'Edit' and 'Delete' buttons for this rule. Below the table, there is an 'Add' button. At the bottom right, there is a 'Save' button.

Policy	Members assigned	Ratio	Sort
balanced	Mobile Wired	3 2	

Rule	Source address	Source port	Destination address	Destination port	Protocol	Policy assigned	Sort
default_rule	—	—	0.0.0.0/0	—	all	balanced	

8 Remote monitoring and administration

RUT9XX supports multiple monitoring and administration possibilities. One can get routers information through SMS or using RMS (Remote Management System). Furthermore, some system related parameters can be obtained using MODBUS or MQTT publisher services. How to use them are described in the 9.19 and 9.20 chapters respectively. The main focus is on parameters, which change from time to time, like signal strength, operators name (it is quite common to change of operator name in countries where inner roaming is used) or module temperature. Although it is also possible to read more static values, like MAC address, router's serial number and many others. The access to the mentioned parameters is implemented in both MODBUS and MQTT publisher applications. Apart from getting of some parameters, MODBUS also supports setting of some system related parameter, for example, change value of digital output. Although it sounds frustrating, this functionality is sometimes useful and necessary.

Some applications, like MQTT publisher or RMS allows monitoring or administrating several routers from one place. It is very useful functionality, when you have few routers and would like to change some parameter using single application. RMS share some similarities with SSH (Secure Shell) and indeed, one of RMS feature is to allows SSH access to remote router. There is no separate chapter about RMS in this manual, because the interface of RMS is very intuitive and user friendly. You can access RMS by using your browser with supplied username and a password at <http://rms.teltonika.lt>

By sending SMS to the router the user can execute some command, like reboot, switch wifi on or off and many others. With each SMS the user need to specify router's administrator password. This is done for authentication purposes. The list of commands that may be executed through the SMS is limited. Full list of commands can be found on Services-SMS Utilities of routers WEB page. More about router's management using SMS can found in chapter 9.8.

Another interesting router monitoring solution is SNMP (Simple Network Management Protocol). By not going into deep details about this protocol, it is another manner to monitor router parameters. It allows the user to check current operator, modem model and other router parameters. Compared to other applications and services, only SNMP have ability to inform the user about the occurrence of specific event (called trap) in the system. The main drawback of this protocol is, that it does not allow to change anything. You can read more about SNMP in chapter 8.9.

Apart from services mentioned earlier, there is one service, which is used only for communication between router and Android type device (phones, etc'). It is called json-rpc and allows to set or get various parameters of the system. JSON-RPC can execute the same commands, like user through SSH. To sum up, this approach opens wide possibilities in communication between router and Android. However, there is no separate topic about JSON-RPC in this manual, because this type of communication is generally not for end-user use.

Each approach has its advantages and disadvantages. In some situations, maybe MQTT publisher works better than MODBUS, while in others, MODBUS will be the better choice. The most versatile manner of system monitoring and administration is through SSH. The SSH provides complete control of the router. The user can execute commands, write shell scripts and do many other things. In such case, the user only needs application to connect router through SSH. The most popular application used in Windows type operating systems is called Putty. If you try to connect to router from Unix like operating system, you only need to execute ssh command with some arguments, like hostname and username (in this case – root).

Sometimes the use of SSH is not necessary, so other more conservative services/applications are used. The complete list of applications and services, which can be used for router administration and monitoring are given below. It can be seen, that all applications, except MQTT publisher and SNMP supports setting/getting of some system related parameter.

	Application	Can obtain parameters	Can set parameters
1.	MQTT publisher	•	○
2.	MODBUS daemon	•	•
3.	SSH	•	•
4.	RMS	•	•
5.	SMS	•	•
6.	SNMP	•	○
7.	JSON-RPC	•	•

By summarizing, RUT9XX provides several solutions for router management. Each user can choose what solution to use. If required functionality is not found in particular service, the user can combine several applications, for example, use MQTT publisher along with SNMP. Finally, if user has special needs, he can write shell script and execute it via SSH or use json-rpc.

9 Services

9.1 VRRP

9.1.1 VRRP LAN Configuration Settings

VRRP LAN Configuration Settings

Enable ☐

IP address 

Virtual ID

Priority

	Field name	Sample	Explanation
1.	Enable	Enable/Disable	Enable VRRP (Virtual Router Redundancy Protocol) for LAN
2.	IP address	192.168.1.253	Virtual IP address for LAN's VRRP (Virtual Router Redundancy Protocol) cluster
3.	Virtual ID	1	Routers with same IDs will be grouped in the same VRRP (Virtual Router Redundancy Protocol) cluster, range [1-255]
4.	Priority	100	Router with highest priority value on the same VRRP (Virtual Router Redundancy Protocol) cluster will act as a master, range [1-255]

9.1.2 Check Internet connection

Check internet connection

Enable ☐

Ping IP address

Ping interval

Ping timeout (sec)

Ping packet size

Ping retry count

	Field name	Sample	Explanation
1.	Enable	Enable/Disable	Enable WAN's connection monitoring
2.	Ping IP address	8.8.4.4	A host to send ICMP (Internet Control Message Protocol) packets to
3.	Ping interval	10	Time interval in seconds between two Pings
4.	Ping timeout (sec)	1	Response timeout value, interval [1 - 9999]
5.	Ping packet size	50	ICMP (Internet Control Message Protocol) packet's size, interval [0 - 1000]
6.	Ping retry count	100	Failed Ping attempt's count before determining that connection is lost, interval [1 – 9999]

9.2 TR-069

TR-069 is a standard developed for automatic configuration and management of remote devices by Auto Configuration Servers (ACS).

9.2.1 TR-069 Parameters Configuration

TR-069 Parameters Configuration

Enable ☐

Enable Periodic Transmission ☐

User name

Password

URL

	Field name	Sample	Explanation
1.	Enable	Enable/Disable	Enable TR-069 client
2.	Enable Periodic Transmission	Enable / Disable	Enable periodic transmissions of data to server
3.	User name	admin	User name for authentication on TR-069 server
4.	Password	*****	Password for authentication on TR-069 server
5.	URL	http://192.168.1.110:8080	TR-069 server URL address

9.3 Web filter

9.3.1 Site blocking

Site Blocking

Proxy Based Content Blocker

Site Blocking Settings

Site Blocking

Enable ☐

Mode Whitelist ▾

Enable	Host name	
☒	www.yahoo.com	Delete
Add		

	Field name	Sample	Explanation
1.	Enable	Enable/Disable	Enable host name based websites blocking
2.	Mode	Whitelist/Blacklist	Whitelist - allow every site on the list and block everything else. Blacklist - block every site on the list and allow everything else.
3.	Enable	Enable/Disable	Check to enable site blocking
4.	Host name	www.yahoo.com	Block/allow site with this hostname

9.3.2 Proxy Based Content Blocker

Site Blocking

Proxy Based Content Blocker

Proxy Based URL Content Blocker Configuration

Proxy Based URL Content Blocker

Enable ☒

Mode Blacklist ▾

URL Filter Rules

Enable	URL content	
☒	example.com	Delete

	Field name	Sample	Explanation
1.	Enable	Enable/Disable	Enable proxy server based URL content blocking. Works with HTTP protocol only
2.	Mode	Whitelist/Blacklist	Whitelist - allow every part of URL on the list and block everything else. Blacklist - block every part of URL on the list and allow everything else
3.	URL content	example.com	Block/allow any URL containing this string. Example.com, example.*, *.example.com

9.4 NTP

NTP configuration lets you setup and synchronize routers time.

General
Time Servers

Time Synchronisation

General

Current system time 2016-03-09 08:32:52
Sync with browser

Time zone UTC

Enable NTP ☒

Update interval (in seconds) 3600

Save time to flash ☐

Count of time synchronizations

Clock Adjustment

Offset frequency 0

Save

	Field name	Description
1.	Current System time	Local time of router.
2.	Time zone	Time zone of your country.
3.	Enable NTP	Enable system's time synchronization with time server using NTP (Network Time

		Protocol)
4.	Update interval	How often router updates systems time
5.	Save time to flash	Save last synchronized time to flash memory
6.	Count of time synchronizations	Total amount of times that router will do the synchronization. Note: If left blank - the count will be infinite
7.	Offset frequency	Adjust the minor drift of the clock so that it will be more accurate

Note, that under **Time Servers** at least one server has to be present, otherwise NTP will not serve its purposes.

9.5 VPN

9.5.1 OpenVPN

VPN (Virtual Private Network) is a method for secure data transfer through unsafe public network. This section explains how to configure OpenVPN, which is implementation of VPN supported by the RUT9 router.

A picture below demonstrates default OpenVPN configurations list, which is empty, so you have to define a new configuration to establish any sort of OpenVPN connection. To create it, enter desired configuration name in **“New configuration name”** field, select device role from **“Role”** drop down list. For example, to create an OpenVPN client with configuration name demo, select client role, name it “demo” and press **“Add New”** button as shown in the following picture.

The screenshot displays the OpenVPN configuration page. At the top, there are tabs for 'OpenVPN', 'IPsec', 'GRE Tunnel', 'PPTP', and 'L2TP'. The 'OpenVPN' tab is selected. Below the tabs, the page title 'OpenVPN' is shown. Underneath, there is a section header 'OpenVPN Configuration'. This section contains a table with the following columns: 'Tunnel name', 'TUN/TAP', 'Protocol', 'Port', and 'Enabled'. The table is currently empty, and a message 'There are no openVPN configurations yet' is displayed below it. At the bottom of the page, there is a form with a 'Role' dropdown menu set to 'Client', a 'New configuration name' text input field containing the text 'demo', and an 'Add New' button.

OpenVPN

IPsecGRE TunnelPPTPL2TP

New OpenVPN instance was created successfully. Configure it now

OpenVPN

OpenVPN Configuration

Tunnel name	TUN/TAP	Protocol	Port	Enable		
Client_demo	Tun_c_demo	UDP	1194	☐	Edit	Delete

Role: ClientNew configuration name: Add New

Save

To see at specific configuration settings press **“edit”** button located in newly created configuration entry. A new page with detailed configuration appears, as shown in the picture below (TLS client example).

OpenVPN Instance: Client_demo

Main Settings

Enable	☐
TUN/TAP	TUN (tunnel) ▼
Protocol	UDP ▼
Port	1194
LZO	☒
Encryption	BF-CBC 128 (default) ▼
Authentication	TLS ▼
TLS cipher	All ▼
Remote host/IP address	215.45.60.66
Resolve retry	Infinite
Keep alive	10 60
Remote network IP address	10.0.0.0
Remote network IP netmask	255.255.255.0
Max routes	100
HMAC authentication algorithm	SHA1 (default) ▼
Additional HMAC authentication	☐
Certificate authority	Browse... No file selected.
Client certificate	Browse... No file selected.
Client key	Browse... No file selected.

There can be multiple server/client instances.

You can set custom settings here according to your VPN needs. Below is summary of parameters available to set:

	Field name	Explanation
1.	Enabled	Switches configuration on and off. This must be selected to make configuration active.
2.	TUN/TAP	Selects virtual VPN interface type. TUN is most often used in typical IP-level VPN connections, however, TAP is required to some Ethernet bridging configurations.
3.	Protocol	Defines a transport protocol used by connection. You can choose here between TCP and UDP.
4.	Port	Defines TCP or UDP port number (make sure, that this port allowed by firewall).
5.	LZO	This setting enables LZO compression. With LZO compression, your VPN connection will generate less network traffic; however, this means higher router CPU loads. Use it carefully with high rate traffic or low CPU resources.

6.	Encryption	Selects Packet encryption algorithm.
7.	Authentication	Sets authentication mode, used to secure data sessions. Two possibilities you have here: "Static key" means, that OpenVPN client and server will use the same secret key, which must be uploaded to the router using "Static pre-shared key" option. "TLS" authentication mode uses X.509 type certificates. Depending on your selected OpenVPN mode (client or server) you have to upload these certificates to the router: For client: Certificate Authority (CA), Client certificate, Client key. For server: Certificate Authority (CA), Server certificate, Server key and Diffie-Hellman (DH) certificate used to key exchange through unsafe data networks. All mention certificates can be generated using OpenVPN or Open SSL utilities on any type host machine. Certificate generation and theory is out of scope of this user manual.
8.	TLS cipher	Packet encryption algorithm (cipher)
9.	Remote host/IP address	IP address of OpenVPN server (applicable only for client configuration).
10.	Resolve Retry	Sets time in seconds to try resolving server hostname periodically in case of first resolve failure before generating service exception.
11.	Keep alive	Defines two time intervals: one is used to periodically send ICMP request to OpenVPN server, and another one defines a time window, which is used to restart OpenVPN service, if no ICMP request is received during the window time slice. Example Keep Alive "10 60"
12.	Remote network IP address	IP address of remote network, an actual LAN network behind another VPN endpoint.
13.	Remote network IP netmask	Subnet mask of remote network, an actual LAN network behind another VPN endpoint.
14.	Max routes	Allow a maximum number of routes to be pulled from an OpenVPN server
15.	HMAC authentication algorithm	Sets HMAC authentication algorithm
16.	Additional HMAC authentication	Add an additional layer of HMAC authentication on top of the TLS control channel to protect against DoS attacks
17.	Certificate authority	Certificate authority is an entity that issues digital certificates. A digital certificate certifies the ownership of a public key by the named subject of the certificate.
18.	Client certificate	Client certificate is a type of digital certificate that is used by client systems to make authenticated requests to a remote server. Client certificates play a key role in many mutual authentication designs, providing strong assurances of a requester's identity.
19.	Client key	Authenticating the client to the server and establishing precisely who they are

After setting any of these parameters press **"Save"** button. Some of selected parameters will be shown in the configuration list table. You should also be aware of the fact that router will launch separate OpenVPN service for every configuration entry (if it is defined as active, of course) so the router has ability to act as server and client at the same time.

9.5.2 IPsec

The IPsec protocol client enables the router to establish a secure connection to an IPsec peer via the Internet. IPsec is supported in two modes - transport and tunnel. Transport mode creates secure point to point channel between two hosts. Tunnel mode can be used to build a secure connection between two remote LANs serving as a VPN solution.

IPsec system maintains two databases: Security Policy Database (SPD) which defines whether to apply IPsec to a packet or not and specify which/how IPsec-SA is applied and Security Association Database (SAD), which contain Key of each IPsec-SA.

The establishment of the Security Association (IPsec-SA) between two peers is needed for IPsec communication. It can be done by using manual or automated configuration.

Note: router starts establishing tunnel when data from router to remote site over tunnel is sent. For automatic tunnel establishment used tunnel Keep Alive feature.

IPsec Configuration

Enable ☒

IKE version IKEv1

Mode Main

My identifier type Address

My identifier 100.121.122.123

Dead Peer Detection ☒

Pre shared key password

Remote VPN endpoint 215.148.3.15

IP address/Subnet mask 192.168.1.0/24

Enable keepalive ☒

Host 192.168.1.125

Ping period (sec) 60

	Field name	Value	Explanation
1.	Enable	Enabled/Disabled	Check box to enable IPsec.
2.	IKE version	IKEv1 or IKEv2	Method of key exchange
3.	Mode	“Main” or “Aggressive”	ISAKMP (Internet Security Association and Key Management Protocol) phase 1 exchange mode
4.	My identifier type	Address, FQDN, User FQDN	Choose one accordingly to your IPsec configuration
5.	My identifier		Set the device identifier for IPsec tunnel. In case RUT has Private IP, its identifier should be its own LAN network address. In this way, the Road Warrior approach is possible.
6.	Dead Peer Detection	Enabled/Disabled	The values clear, hold and restart all active DPD
7.	Pre shared key		A shared password to authenticate between the peer

8.	Remote VPN endpoint		Domain name or IP address. Leave empty or any
9.	IP address/Subnet mask		Remote network secure group IP address and mask used to determine to what subnet an IP address belongs to. Range [0-32]. IP should differ from device LAN IP
10.	Enable keep alive	Enabled/Disabled	Enable tunnel keep alive function
11.	Host		A host address to which ICMP (Internet Control Message Protocol) echo requests will be send
12.	Ping period (sec)		Send ICMP echo request every x seconds. Range [0-999999]

Phase 1 and **Phase 2** must be configured accordingly to the IPSec server configuration, thus algorithms, authentication and lifetimes of each phase must be identical.

Phase

The phase must match with another incoming connection to establish IPSec

Phase 1

Phase 2

Encryption algorithm

3DES

Authentication

SHA1

DH group

MODP1536

Lifetime (h)

8

Minutes

Phase

The phase must match with another incoming connection to establish IPSec

Phase 1

Phase 2

Encryption algorithm

3DES

Hash algorithm

SHA1

PFS group

MODP1536

Lifetime (h)

8

Hours

	Field name	Value	Explanation
1.	Encryption algorithm	DES, 3DES, AES 128, AES 192, AES256	The encryption algorithm must match with another incoming connection to establish IPSec
2.	Authentication	MD5, SHA1, SHA256, SHA384, SHA512	The authentication algorithm must match with another incoming connection to establish IPSec
3.	Hash algorithm	MD5, SHA1, SHA256, SHA384, SHA512	The hash algorithm must match with another incoming connection to establish IPSec
4.	DH group	MODP768, MODP1024, MODP1536, MODP2048, MODP3072, MODP4096	The DH (Diffie-Helman) group must with another incoming connection to establish IPSec
4.	PFS group	MODP768, MODP1024, MODP1536, MODP2048, MODP3072, MODP4096, No PFS	The PFS (Perfect Forward Secrecy) group must match with another incoming connection to establish IPSec
5.	Lifetime	Hours, Minutes, Seconds	The time duration for phase

9.5.3 GRE Tunnel

GRE (Generic Routing Encapsulation RFC2784) is a solution for tunneling RFC1812 private address-space traffic over an intermediate TCP/IP network such as the Internet. GRE tunneling does not use encryption it simply encapsulates data and sends it over the WAN.

In the example network diagram two distant networks LAN1 and LAN2 are connected.

To create GRE tunnel the user must know the following parameters:

1. Source and destination IP addresses.
2. Tunnel local IP address
3. Distant network IP address and Subnet mask.

OpenVPN	IPsec	GRE Tunnel	PPTP	L2TP
Gre-tunnel Instance: Gre_tunnel				
Main Settings				
Enabled ☒				
Remote endpoint IP address 84.148.7.87				
Remote network 192.168.2.0				
Remote network netmask 24				
Local tunnel IP 10.0.0.1				
Local tunnel netmask 24				
MTU 1500				
TTL 255				
PMTUD ☒				
Enable Keep alive ☒				
Keep Alive host				
Keep Alive interval				

	Field name	Explanation
1.	Enabled	Check the box to enable the GRE Tunnel function.
2.	Remote endpoint IP address	Specify remote WAN IP address.
3.	Remote network	IP address of LAN network on the remote device.
4.	Remote network netmask	Network of LAN network on the remote device. Range [0-32].
5.	Local tunnel IP	Local virtual IP address. Cannot be in the same subnet as LAN network.
6.	Local tunnel netmask	Network of local virtual IP address. Range [0-32]
7.	MTU	Specify the maximum transmission unit (MTU) of a communications protocol of a layer in bytes.
8.	TTL	Specify the fixed time-to-live (TTL) value on tunneled packets [0-255]. The 0 is a special value meaning that packets inherit the TTL value.
9.	PMTUD	Check the box to enable the Path Maximum Transmission Unit Discovery (PMTUD) status on this tunnel.
10.	Enable Keep alive	It gives the ability for one side to originate and receive keep alive packets to and from a remote router even if the remote router does not support GRE keep alive.
11.	Keep Alive host	Keep Alive host IP address. Preferably IP address which belongs to the LAN network on the remote device.
12.	Keep Alive interval	Time interval for Keep Alive. Range [0 - 255].

9.5.4 PPTP

Point-to-Point Tunneling Protocol (PPTP) is a protocol (set of communication rules) that allows corporations to extend their own corporate network through private "tunnels" over the public Internet. Effectively, a corporation uses a wide-area network as a single large local area network. A company no longer needs to lease its own lines for wide-area communication but can securely use the public networks. This kind of interconnection is known as a virtual private network (VPN).

Username

Password

9.6 Dynamic DNS

Dynamic DNS (DDNS) is a domain name service allowing to link dynamic IP addresses to static hostname.

To start using this feature firstly you should register to DDNS service provider (example list is given in description).

You are provided with add/delete buttons to manage and use different DDNS configurations at the same time!

You can configure many different DDNS Hostnames in the main DDNS Configuration section.

DDNS

DDNS Configuration

DDNS name	Hostname	Status	Enable	
Myddns	yourhost.example.org	N/A	☐	Edit Delete

New configuration name:

To edit your selected configuration, hit **Edit**.

DDNS

Enable ☐

Status N/A

Service

Hostname

User name

Password

IP source

Network

IP renew interval (min)

Force IP renew (min)

	Field name	Value	Explanation
1.	Enable	Enable/Disable	Enables current DDNS configuration.
2.	Status		Timestamp of the last IP check or update.
3.	Service	1. dydns.org 2. 3322.org 3. no-ip.com 4. easydns.com 5. zoneedit.com	Your dynamic DNS service provider selected from the list. In case your DDNS provider is not present from the ones provided, please feel free to use "custom" and add hostname of the update URL.
4.	Hostname	yourhost.example.org	Domain name which will be linked with dynamic IP address.
5.	Username	your_username	Name of the user account.
6.	Password	your_password	Password of the user account.
7.	IP Source	Public Private Custom	This option allows you to select specific RUT interface, and then send the IP address of that interface to DDNS server. So if, for example, your RUT has Private IP (i.e. 10.140.56.57) on its WAN (3G interface), then you can send this exact IP to DDNS server by selecting "Private", or by selecting "Custom" and "WAN" interface. The DDNS server will then resolve hostname queries to this specific IP.

8.	Network	WAN	Source network
9.	IP renew interval (min)	10 (minutes)	Time interval (in minutes) to check if the IP address of the device have changed.
10.	Force IP renew	472 (minutes)	Time interval (in minutes) to force IP address renew.

9.7 SMS Utilities

RUT950 has extensive amount of various SMS Utilities. These are subdivided into 6 sections: SMS Utilities, Call Utilities, User Groups, SMS Management, Remote Configuration and Statistics.

9.7.1 SMS Utilities

SMS Utilities	Call Utilities	User Groups	SMS Management	Remote Configuration	Statistics
SMS Utilities					
SMS Rules					
Action	SMS Text	Enable	Sort		
Reboot	reboot	☒		Edit	Delete
Get status	status	☒		Edit	Delete
Get OpenVPN status	vpnstatus	☒		Edit	Delete
Switch WiFi on	wifion	☒		Edit	Delete

All configuration options are listed below:

- Reboot
- Get status
- Get OpenVPN status
- Switch WiFi on/off
- Switch mobile data on/off
- Change mobile data settings
- Get list of profiles
- Change profile
- Manage OpenVPN
- SSh access control
- Web access control
- Restore to default
- Force SIM switch
- FW upgrade from server
- Config update from server
- Switch monitoring on/off

You can choose your SMS Keyword (text to be sent) and authorized phone number in the main menu. You can edit each created rule by hitting **Edit** button.

	Field name	Explanation	Notes
1.	Reboot		
	Enable	This check box will enable and disable SMS reboot function.	Allows router restart via SMS.
	Action	The action to be performed when this rule is met.	
	SMS text	SMS text which will reboot router.	SMS text can contain letters, numbers, spaces and special symbols. Capital letters also matters.
	Authorization method	What kind of authorization to use for SIM management.	No authorization, by serial or by router admin password.
	Allowed users	Whitelist of allow users	From all numbers, from group or from single number.
	Get status via SMS after reboot	Check this to receive connection status via SMS after a reboot.	If you select this box, router will send status once it has rebooted and is operational again. This is both separate SMS Rule and an option under SMS Reboot rule.
	Message text	Which status information should be included in SMS: Data state, Operator, Connection type, Signal Strength, Connection State, IP	You can select which status elements to display.
2.	Get status		
	Enable	Check this to receive connection status via SMS.	Allows to get router's status via SMS. This is both separate SMS Rule and an option under SMS Reboot rule.
	Action	The action to be performed	

		when this rule is met.	
	Enable SMS Status	This check box will enable and disable SMS status function.	SMS status is disabled by default.
	SMS text	SMS text which will send routers status.	SMS text can contain letters, numbers, spaces and special symbols. Capital letters also matters.
	Authorization method	What kind of authorization to use for SIM management.	No authorization, by serial or by router admin password.
	Allowed users	Whitelist of allow users	From all numbers, from group or from single number.
	Message text	Which status information should be included in SMS: Data state, Operator, Connection type, Signal Strength, Connection State, IP	You can select which status elements to display.
3.	Get OpenVPN status		
	Enable	This check box will enable and disable this function.	Allows to get OpenVPN's status via SMS.
	Action	The action to be performed when this rule is met.	
	SMS text	SMS text which will send OpenVPN status.	SMS text can contain letters, numbers, spaces and special symbols. Capital letters also matters.
	Authorization method	What kind of authorization to use for SIM management.	No authorization, by serial or by router admin password.
	Allowed users	Whitelist of allow users	From all numbers, from group or from single number.
4.	Switch WiFi On/Off		
	Enable	This check box will enable and disable this function.	Allows Wi-Fi control via SMS.
	Action	The action to be performed when this rule is met.	Turn WiFi ON or OFF.
	SMS text	SMS text which will turn Wi-Fi ON/OFF.	SMS text can contain letters, numbers, spaces and special symbols. Capital letters also matters.
	Authorization method	What kind of authorization to use for SIM management.	No authorization, by serial or by router admin password.
	Allowed users	Whitelist of allow users	From all numbers, from group or from single number.
	Write to config	Permanently saves Wi-Fi state.	With this setting enabled, router will keep Wi-Fi state even after reboot. If it is not selected, router will revert Wi-Fi state after reboot.
5.	Switch mobile data on/off		
	Enable	This check box will enable and disable this function.	Allows mobile control via SMS.
	Action	The action to be performed when this rule is met.	Turn mobile ON or OFF.
	SMS text	SMS text which will turn mobile data ON/OFF.	SMS text can contain letters, numbers, spaces and special symbols. Capital letters also matters.
	Authorization method	What kind of authorization to use for SIM management.	No authorization, by serial or by router admin password.
	Allowed users	Whitelist of allow users	From all numbers, from group or from single number.
	Write to config	Permanently saves mobile network state.	With this setting enabled, router will keep mobile state even after reboot.

			If it is not selected, router will revert mobile state after reboot.
6.	Manage OpenVPN		
	Enable	This check box will enable and disable this function.	Allows OpenVPN control via SMS.
	Action	The action to be performed when this rule is met.	Turn OpenVPN ON or OFF.
	SMS text	Keyword which will turn OpenVPN ON/OFF.	SMS text can contain letters, numbers, spaces and special symbols. Capital letters also matters. After Keyword you have to write OpenVPN name.
	Authorization method	What kind of authorization to use for SIM management.	No authorization, by serial or by router admin password.
	Allowed users	Whitelist of allow users	From all numbers, from group or from single number.
7.	Change mobile data settings		
	Enable	This check box will enable and disable this function.	Allows to change mobile settings via SMS.
	Action	The action to be performed when this rule is met.	
	SMS text	Key word that will precede actual configuration parameters.	SMS text can contain letters, numbers, spaces and special symbols. Capital letters also matters.
	Authorization method	What kind of authorization to use for SIM management.	No authorization, by serial or by router admin password.
	Allowed users	Whitelist of allow users	From all numbers, from group or from single number.

Mobile Settings via SMS parameters:

	Parameter	Value(s)	Explanation
1.	apn=	e.g. internet.gprs	Sets APN. i.e: apn=internet.gprs
2.	dialnumber=	e.g. *99***1#	Sets dial number
3.	auth_mode=	none pap chap	Sets authentication mode
4.	service=	Auto 4gpreferred 4gonly 3gpreferred 3gonly 2gpreferred 2gonly	You can add as many phone numbers as you need. Dropdown list with additional rows will show up if you click on "add" icon at the end of phone number row.
5.	username=	user	Used only if PAP or CHAP authorization is selected
6.	password=	user	Used only if PAP or CHAP authorization is selected

All Mobile settings can be changed in one SMS. Between each <parameter=value> pair a space symbol is necessary.

Example: *cellular apn=internet.gprs dialnumber=*99***1#auth_mode=pap service=3gonly username=user password=user*

Important Notes:

- 3G settings must be configured correctly. If SIM card has PIN number you must enter it at “Network” > “3G” settings. Otherwise SMS reboot function will not work.
- Sender phone number must contain country code. You can check sender phone number format by reading the details of old SMS text messages you receiving usually.

	Field name	Explanation	Notes
8.	Get list of profiles		
	Enable	This check box will enable and disable this function.	Allows to get list of profiles via SMS.
	Action	The action to be performed when this rule is met.	
	SMS text	SMS text which will send list of profiles.	SMS text can contain letters, numbers, spaces and special symbols. Capital letters also matters.
	Authorization method	What kind of authorization to use for SIM management.	No authorization, by serial or by router admin password.
	Allowed users	Whitelist of allow users	From all numbers, from group or from single number.
9.	Change profile		
	Enable	This check box will enable and disable this function.	Allows profile change via SMS.
	Action	The action to be performed when this rule is met.	
	SMS text	Keyword which will change active profile.	SMS text can contain letters, numbers, spaces and special symbols. Capital letters also matters. After Keyword you have to write profile name.
	Authorization method	What kind of authorization to use for SIM management.	No authorization, by serial or by router admin password.
	Allowed users	Whitelist of allow users	From all numbers, from group or from single number.
10.	SSH access Control		
	Enable	This check box will enable and disable this function.	Allows SSH access control via SMS.
	Action	The action to be performed when this rule is met.	
	SMS text	SMS text which will turn SSH access ON/OFF.	SMS text can contain letters, numbers, spaces and special symbols. Capital letters also matters.
	Authorization method	What kind of authorization to use for SIM management.	No authorization, by serial or by router admin password.
	Allowed users	Whitelist of allow users	From all numbers, from group or from single number.
	Enable SSH access	Enable this to reach router via SSH from LAN (Local Area Network).	If this box is selected, SMS will enable SSH access from LAN. If this box is not selected, SMS will disable SSH access from LAN.
	Enable remote SSH access	Enable this to reach router via SSH from WAN (Wide Area Network).	If this box is selected, SMS will enable SSH access from WAN. If this box is not selected, SMS will disable SSH access from WAN.
11.	Web access Control		
	Enable	This check box will enable and disable this function.	Allows Web access control via SMS.
	Action	The action to be performed when this rule is met.	
	SMS text	SMS text which will turn Web	SMS text can contain letters, numbers, spaces and

		access ON/OFF.	special symbols. Capital letters also matters.
	Authorization method	What kind of authorization to use for SIM management.	No authorization, by serial or by router admin password.
	Allowed users	Whitelist of allow users	From all numbers, from group or from single number.
	Enable HTTP access	Enable this to reach router via HTTP from LAN (Local Area Network).	If this box is selected, SMS will enable HTTP access from LAN. If this box is not selected, SMS will disable HTTP access from LAN.
	Enable remote HTTP access	Enable this to reach router via HTTP from WAN (Wide Area Network).	If this box is selected, SMS will enable HTTP access from WAN. If this box is not selected, SMS will disable HTTP access from WAN.
	Enable remote HTTPS access	Enable this to reach router via HTTPS from WAN (Wide Area Network).	If this box is selected, SMS will enable HTTPS access from WAN. If this box is not selected, SMS will disable HTTPS access from WAN.
12.	Restore to default		
	Enable	This check box will enable and disable this function.	Allows to restore router to default settings via SMS.
	Action	The action to be performed when this rule is met.	Router will reboot after this rule is executed.
	SMS text	SMS text which will turn Wi-Fi ON/OFF.	SMS text can contain letters, numbers, spaces and special symbols. Capital letters also matters.
	Authorization method	What kind of authorization to use for SIM management.	No authorization, by serial or by router admin password.
	Allowed users	Whitelist of allow users	From all numbers, from group or from single number.
13.	Force switch SIM		
	Enable	This check box will enable and disable this function.	Allows SIM switch via SMS.
	Action	The action to be performed when this rule is met.	
	SMS text	SMS text which will change active SIM card to another one.	SMS text can contain letters, numbers, spaces and special symbols. Capital letters also matters.
	Authorization method	What kind of authorization to use for SIM management.	No authorization, by serial or by router admin password.
	Allowed users	Whitelist of allow users	From all numbers, from group or from single number.
	Sender phone number	Phone number of person who can receive router status via SMS message.	You can add as many phone numbers as you need. Dropdown list with additional rows will show up if you click on "add" icon at the end of phone number row.
14.	Force FW upgrade from server		
	Enable	This check box will enable and disable this function.	Allows to upgrade router's FW via SMS.
	Action	The action to be performed when this rule is met.	Router will reboot after this rule is executed.
	SMS text	SMS text which will force router to upgrade firmware from server.	SMS text can contain letters, numbers, spaces and special symbols. Capital letters also matters.
	Authorization method	What kind of authorization to use for SIM management.	No authorization, by serial or by router admin password.
	Allowed users	Whitelist of allow users	From all numbers, from group or from single number.

15.	Force Config update from server		
	Enable	This check box will enable and disable this function.	Allows to upgrade router's Config via SMS.
	Action	The action to be performed when this rule is met.	Router will reboot after this rule is executed.
	SMS text	SMS text which will force router to upgrade configuration from server.	SMS text can contain letters, numbers, spaces and special symbols. Capital letters also matters.
	Authorization method	What kind of authorization to use for SIM management.	No authorization, by serial or by router admin password.
	Allowed users	Whitelist of allow users	From all numbers, from group or from single number.
16.	Switch monitoring on/off		
	Enable	This check box will enable and disable this function.	Allows monitoring control via SMS.
	Action	The action to be performed when this rule is met.	Turn monitoring ON or OFF.
	SMS text	SMS text which will turn monitoring ON/OFF	SMS text can contain letters, numbers, spaces and special symbols. Capital letters also matters.
	Authorization method	What kind of authorization to use for SIM management.	By serial or by router admin password.
	Allowed users	Whitelist of allow users	From all uers, from group or from single number.

Important Notes:

- 3G settings must be configured correctly. If SIM card has PIN number you must enter it at "Network" > "3G" settings. Otherwise SMS reboot function will not work.
- Sender phone number must contain country code. You can check sender phone number format by reading the details of old SMS text messages you receiving usually.

9.7.2 Call Utilities

Allow users to call to the router in order to perform one of the actions: Reboot, Get Status, turn Wi-Fi ON/OFF, turn Mobile data ON/OFF. Only thing that is needed is to call routers SIM card number from allowed phone (user) and RUT9 will perform all actions that are assigned for this particular number. To configure new action on call rules you just need to click the Add button in the „New Call rule” section. After that, you get in to the “Modify Call Rule section”.

Modify Call Rule

Enable ☐

Action Reboot

Allowed users From all numbers

Get status via SMS after reboot ☐

	Field name	Sample	Explanation
1.	Enable	Enable/Disable	Enables the rule
2.	Action	Reboot	Action to be taken after receiving a call, you can choose from following actions: Reboot, Send status, Switch Wi-Fi, Switch mobile data.
3.	Allowed users	From all numbers	Allows to limit action triggering from all users, to user groups or single user numbers
4.	Get status via SMS after reboot	Enable/Disable	Enables automatic message sending with router status information after reboot

9.7.2.1 Incoming Calls

Incoming Calls

Reject unrecognized incoming calls ☒

Save

	Field name	Sample	Explanation
1.	Reject unrecognized incoming calls	Enable/Disable	If a call is made from number that is not in the active rule list, it can be rejected with this option

9.7.3 User Groups

Give possibility to group phone numbers for SMS management purposes. You can then later use these groups in all related SMS functionalities. This option helps if there are several Users who should have same roles when managing router via SMS. You can create new user group by entering group name and clicking on Add button in “Create New User Group” section. After that you get to “Modify User Group” section.

Modify User Group

Group name

Phone number 

	Field name	Sample	Explanation
1.	Group name	Group1	Name of grouped phone numbers
2.	Phone number	+37061111111	Number to add to users group, must match international format. You can add phone numbers fields by clicking on the green + symbol

9.7.4 SMS Management

9.7.4.1 Read SMS

In SMS Management page Read SMS you can read and delete received/stored SMS.

The screenshot shows the 'Read SMS' interface. At the top, there are tabs: 'SMS Utilities', 'Call Utilities', 'User Groups', 'SMS Management' (selected), 'Remote Configuration', and 'Statistics'. Below these are sub-tabs: 'Read SMS' (selected), 'Send SMS', and 'Storage'. The main area is titled 'SMS Messages'. It includes a 'SMS per page' dropdown set to '10' and a 'Search' input field. A table displays one message with columns: 'Date', 'Sender', 'Message', and a checkbox. The message details are: Date: 2016-05-05 13:51:56, Sender: +370612345678, Message: Labas. Below the table, it says 'Showing 1 to 1 of 1 entries'. At the bottom right are buttons for 'Refresh', 'Delete', and 'Select all'.

Date	Sender	Message	
2016-05-05 13:51:56	+370612345678	Labas	☐

9.7.4.2 Send SMS

The screenshot shows the 'Send SMS' interface. At the top, there are tabs: 'Read SMS', 'Send SMS' (selected), and 'Storage'. The main area is titled 'Send SMS'. Below it is a section 'Send SMS Message'. It contains a 'Phone Number' input field with the value '+3701111111' and a 'Message' text area with the value 'My text.'. Below the text area, it says 'SMS 1 (152 characters left)'. At the bottom right is a 'Send' button.

	Field name	Sample	Explanation
1.	Phone number	+3701111111	Recipients phone number. Should be preceded with country code, i.e. "+370"
2.	Message	My text.	Message text, special characters are allowed.

9.7.4.3 Storage

With **storage** option you can choose for router NOT to delete SMS from SIM card. If this option is not used, router will automatically delete all incoming messages after they have been read. Message status "read/unread" is examined every 60 seconds. All "read" messages are deleted.

Read SMS
Send SMS
Storage

SMS Storing

Configuration

Save messages on SIM ☒

SIM card memory Used:0 Available: 50

Leave free space

Save

	Field name	Sample	Explanation
1.	Save messages on SIM	Enabled / Disabled	Enables received message storing on SIM card
2.	SIM card memory	Used: 0 Available: 50	Information about used/available SIM card memory
3.	Leave free space	1	How much memory (number of message should be left free

9.7.5 Remote Configuration

RUT9xx can be configured via SMS from another RUT9xx. You only have to select which configuration details have to be sent, generate the SMS Text, type in the phone number and Serial number of the router that you wish to configure and Send the SMS.

Total count of SMS is managed automatically. You should be aware of possible number of SMS and use this feature at your own responsibility. It should not, generally, be used if you have high cost per SMS. This is especially relevant if you will try to send whole OpenVPN configuration, which might acumulate ~40 SMS.

9.7.5.1 Receive configuration

This section controls how configuration initiation party should identify itself. In this scenario RUT950 itself is being configured.

Recieve Configuration

Receive Configuration

Enable ☒

Authorization method

Allowed users

Field name	Values	Notes
------------	--------	-------

1.	Enable	Enabled / Disabled	Enables router to receive configuration
1.	Authorization method	No authorization / By serial By administration password	Describes what kind of authorization to use for SMS management. Method at Receiving and Sending ends must match
2.	Allowed users	From all numbers From group From single number	Gives greater control and security measures

Note, that for safety reasons Authorization method should be configured before deployment of the router.

9.7.5.2 Send configuration

This section lets you configure remote RUT950 devices. The authorization settings must confirm to those that are set on the receiving party.

9.9 SMS Gateway

9.9.1 Post/Get Configuration

Post/Get Configuration allows you to perform actions by writing these requests URI after your device IP address.

Post/Get	Email To SMS	Scheduled SMS	Auto Reply	SMS Forwarding	SMPP
-----------------	---------------------	----------------------	-------------------	-----------------------	-------------

Post/Get Configuration

SMS Post/Get Settings

Enable ☒

User name

Password 

Save

	Field name	Values	Notes
1.	Enable	Enabled / Disabled	Enable SMS management functionality through POST/GET
2.	User name	admin	User name used for authorization
3.	Password	*****	Password used for authorization (default- admin01)

Do not forget to change parameters in the url according to your POST/GET Configuration!

9.9.1.1 SMS by HTTP POST/GET

It is possible to read and send SMS by using valid HTTP POST/GET syntax. Use web browser or any other compatible software to submit HTTP POST/GET string to router. Router must be connected to GSM network when using “SMS send” feature.

	Action	POST/GET url e.g.
1.	View mobile messages list	/cgi-bin/sms_list?username=admin&password=admin01
2.	Read mobile message	/cgi-bin/sms_read?username=admin&password=admin01&number=1
3.	Send mobile messages	/cgi-bin/sms_send?username=admin&password=admin01&number=0037060000001&text=testmessage
4.	View mobile messages total	/cgi-bin/sms_total?username=admin&password=admin01
5.	Delete mobile message	/cgi-bin/sms_delete?username=admin&password=admin01&number=1

9.9.1.2 Syntax of HTTP POST/GET string

HTTP POST/GET string		Explanation
http://{IP_ADDRESS}	/cgi-bin/sms_read? username={your_user_name}&password={your_password}&number={MESSAGE_INDEX}	Read message
	/cgi-bin/sms_send? username={your_user_name}&password={your_password}&number={PHONE_NUMBER} &text={MESSAGE_TEXT}	Send message

	/cgi-bin/sms_delete? username={your_user_name}&password={your_password}&number={MESSAGE_INDEX}	Delete message
	/cgi-bin/sms_list? username={your_user_name}&password={your_password}	List all messages
	/cgi-bin/sms_total? username={your_user_name}&password={your_password}	Number of messages in memory

Note: parameters of HTTP POST/GET string are in capital letters inside curly brackets. Curly brackets ("{}") are not needed when submitting HTTP POST/GET string.

9.9.1.3 Parameters of HTTP POST/GET string

	Parameter	Explanation
1.	IP_ADDRESS	IP address of your router
2.	MESSAGE_INDEX	SMS index in memory
3.	PHONE_NUMBER	Phone number of the message receiver. Note: Phone number must contain country code. Phone number format is: 00{COUNTRY_CODE} {RECEIVER_NUMBER}. E.g.: 0037062312345 (370 is country code and 62312345 is receiver phone number)
4.	MESSAGE_TEXT	Text of SMS. Note: Maximum number of characters per SMS is 160. You cannot send longer messages. It is suggested to use alphanumeric characters only.

After every executed command router will respond with return status.

9.9.1.4 Possible responses after command execution

	Response	Explanation
1.	OK	Command executed successfully
2.	ERROR	An error occurred while executing command
3.	TIMEOUT	No response from the module received
4.	WRONG_NUMBER	SMS receiver number format is incorrect or SMS index number is incorrect
5.	NO MESSAGE	There is no message in memory by given index
6.	NO MESSAGES	There are no stored messages in memory

9.9.1.5 HTTP POST/GET string examples

http://192.168.1.1/cgi-bin/sms_read?username=admin&password=admin01&number=2

http://192.168.1.1/cgi-bin/sms_send?username=admin&password=admin01&number=0037060000001&text=message

9.10 Hotspot

Wireless hotspot provides essential functionality for managing an open access wireless network. In addition to standard RADIUS server authentication there is also the ability to gather and upload detailed logs on what each device (denoted as a MAC address) was doing on the network (what sites were traversed, etc.).

9.10.1 General settings

Users Configuration

User name	Password	Idle timeout	Session timeout	Download bandwidth	Upload bandwidth
There are no users created yet.					
Username		Password			
		Add			

	Field name	Explanation
1.	Enabled	Check this flag to enable hotspot functionality on the router.
2.	AP IP	Access Point IP address. This will be the address of the router on the hotspot network. The router will automatically create a network according to its own IP and the CIDR number that you specify after the slash. E.g. "192.168.2.254/24" means that the router will create a network with the IP address 192.168.182.0, netmask 255.255.255.0 for the express purpose of containing all the wireless clients. Such a network will be able to have 253 clients (their IP addresses will be automatically granted to them and will range from 192.168.2.1 to 192.168.2.253).
Authentication mode: External radius		
1.	Radius server #1	The IP address of the RADIUS server that is to be used for Authenticating your wireless clients.

2.	Radius server #2	The IP address of the second RADIUS server.
3.	Authentication port	RADIUS server authentication port.
4.	Accounting port	RADIUS server accounting port.
5.	Radius secret key	The secret key is used for authentication with the RADIUS server
6.	UAM port	Port to bind for authenticating clients
7.	UAM UI port	UAM UI port
8.	UAM secret	Shared secret between UAM server an hotspot
9.	NAS Identifier	NAS Identifier
10.	Swap octets	Swap the meaning of input octets and output as it related to RADIUS attributes
11.	Location name	The name of location

Authentication mode: Internal radius/Without radius

1.	External landing page	Enables the use of external landing page.
2.	Landing page address	The address of external landing page
3.	HTTPS redirect	Redirects HTTP pages to landing page.

Authentication mode: SMS OTP

In the sections – “Terms Of Services”, “Background Configuration”, “Logo Image Configuration”, “Link Configuration”, “Text Configuration” you can customize various parameters of landing page components.

9.10.4.2 Template

In this page you can review landing page template HTML code and modify it.

The screenshot shows the 'Landing Page Template Editor' interface. At the top, there are two tabs: 'General' and 'Template', with 'Template' being the active tab. Below the tabs is the title 'Landing Page Template Editor' and a subtitle 'Modify login page template by your needs'. The main area contains a text editor with the following HTML code:

```
<html lang="en">
<head>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <title>$pageTitle$</title>
  <link rel="stylesheet" href="/luci-static/teltonikaExp/style.css">
  <link rel="stylesheet" href="/luci-static/resources/loginpage.css">
  <link rel="shortcut icon" href="/luci-static/teltonikaExp/favicon.ico">
  <style>
    .login_button {
      margin-top: 15px;
      text-align: center;
    }

    .cbi-map-descr {
      text-align: center;
    }
  </style>
</head>
<body>
  <div class="login">
    <div class="login-button">
      <button type="button">Login</button>
    </div>
  </div>
</body>
</html>
```

At the bottom left of the editor, there is a 'Reset' button.

9.10.5 Radius server configuration

An authentication and accounting system used by many Internet Service Providers (ISPs). When you dial in to the ISP you must enter your username and password. This information is passed to a RADIUS server, which checks that the information is correct, and then authorizes access to the ISP system.

The screenshot shows the 'Radius Server Configuration' interface. At the top, there are several tabs: 'General', 'Restricted Internet Access', 'Logging', 'Landing Page', 'Radius Server', and 'Statistics', with 'Radius Server' being the active tab. Below the tabs is the title 'Radius Server Configuration'. The interface is divided into three main sections: 'General Settings', 'Users Configuration Settings', and 'Clients Configuration Settings'. The 'General Settings' section includes checkboxes for 'Enable' and 'Remote access', and input fields for 'Accounting port' (1813) and 'Authentication port' (1812). The 'Users Configuration Settings' section includes a table with columns for 'Enable', 'User name', 'Reply message', 'Idle timeout', 'Session timeout', 'Download bandwidth', and 'Upload bandwidth'. Below the table, there is a message 'There are no users created yet.' and a form with 'Username' and 'Password' input fields and an 'Add' button. The 'Clients Configuration Settings' section includes a table with columns for 'Enable', 'Client name', 'IP address', 'Netmask', and 'Radius shared secret'. Below the table, there is a message 'There are no clients created yet.' and an 'Add' button.

	Field name	Explanation
1.	Enable	Activates an authentication and accounting system
2.	Remote access	Activates remote access to radius server
3.	Accounting port	Port on which to listen for accounting
4.	Authentication port	Port on which to listen for authentication

9.12 Auto Reboot

9.12.1 Ping Reboot

Ping Reboot function will periodically send Ping command to server and waits for echo receive. If no echo is received router will try again sending Ping command defined number times, after defined time interval. If no echo is received after the defined number of unsuccessful retries, router will reboot. It is possible to turn of the router rebooting after defined unsuccessful retries. Therefore this feature can be used as “Keep Alive” function, when router Pings the host unlimited number of times. Possible actions if no echo is received: Reboot, Modem restart, Restart mobile connection, (Re) register, None.

Ping Reboot

Ping Reboot Settings

Enable ☐

Action if no echo is received Reboot

Interval between pings 5 mins

Ping timeout (sec)

Packet size

Retry count

Interface Ping from mobile

Host to ping from SIM 1

Host to ping from SIM 2

	Field name	Explanation	Notes
1.	Enable	This check box will enable or disable Ping reboot feature.	Ping Reboot is disabled by default.
2.	Action if no echo is received	Action after the defined number of unsuccessful retries	No echo reply for sent ICMP (Internet Control Message Protocol) packet received
3.	Interval between pings	Time interval in minutes between two Pings.	Minimum time interval is 5 minutes.
4.	Ping timeout (sec)	Time after which consider that Ping has failed.	Range(1-9999)
5.	Packet size	This box allows to modify sent packet size	Should be left default, unless necessary otherwise
6.	Retry count	Number of times to try sending Ping to server after time interval if echo receive was unsuccessful.	Minimum retry number is 1. Second retry will be done after defined time interval.
8.	Interface	Interface used for connection	
7.	Host to ping from SIM 1	IP address or domain name which will be used to send ping packets to. E.g. 127.0.0.1 (or www.host.com if DNS server is configured correctly)	Ping packets will be sending from SIM1.
8.	Host to ping from SIM 2	IP address or domain name which will be used to send ping packets to. E.g. 127.0.0.1 (or www.host.com if DNS server is configured correctly)	Ping packets will be sending from SIM2.

1.	Use UPnP port mapping	Enable UPnP port mapping functionality
2.	Use NAT-PMP port mapping	Enable NAT-PMP mapping functionality
3.	Device UUID	Specify Universal unique ID of the device

9.13.3 UPnP ACLs

ACLs specify which external ports may be redirected to which internal addresses and ports.

UPnP ACLs

ACLs specify which external ports may be redirected to which internal addresses and ports

Comment	External ports	Internal addresses	Internal ports	Action	Sort
Allow high ports	1024-65535	0.0.0.0/0	1024-65535	allow	
Add Delete					

	Field name	Explanation
1.	Comment	Add comment to this rule
2.	External ports	External ports which may be redirected
3.	Internal addresses	Internal address to be redirect to
4.	Internal ports	Internal ports to be redirect to
5.	Action	Allow or forbid UPNP service to open the specified port

9.13.4 Active UPnP Redirects

Active UPnP Redirects

Protocol	External Port	Client Address	Client Port
There are no active redirects.			

9.14 QoS

QoS (Quality of Service) is the idea that transmission rates, error rates, and other characteristics can be measured, improved, and, to some extent, guaranteed in advance. QoS is of particular concern for the continuous transmission of high-bandwidth video and multimedia information.

QoS can be improved with traffic shaping techniques such as packet, network traffic, and port prioritization.

Interfaces

Interface	Enable	Calculate overhead	Half-duplex	Download speed (kbit/s)	Upload speed (kbit/s)
WAN	☐	☐	☐	1024	128

Express	All	All	All	All	5190			Delete

	Field name	Explanation
1.	Target	Select target for which rule will be applied
2.	Source host	Select host from which data will be transmitted
3.	Destination host	Select host to which data will be transmitted
4.	Service	Select service for which rule will be applied
5.	Protocol	Select data transmission protocol
6.	Ports	Select which port will be used for transmission
7.	Number of bytes	Specify the maximal number of bytes for connection

9.15 MQTT

MQTT also known as MQ Telemetry Transport is an publish-subscribe based messaging protocol for use on top of the TCP/IP protocol. It is designed to send short messages from one client (publisher) to another (subscriber) through the brokers, which are responsible for message delivery to the end point. RUT 9XX routers do support this functionality via open source Mosquitto broker. The messages are sent in this way: some client (subscriber) subscribes to specific topic or many of them, and then publisher posts some message to specific topic. The broker then checks who is subscribed to particular topic and transmits data from publisher to subscriber.

RUT9XX supports some functionality of the MQTT broker and MQTT publisher. The main window of parameters is presented below. The broker can be enabled by checking *Enable* and entering the port number on which MQTT broker should run to. In order to accept connections from WAN interface, *Enable Remote Access* should be checked also.

MQTT Broker

Enable ☐

Local Port

Enable Remote Access ☐

Broker settings

TLS version

Support all

The MQTT broker also supports option called *Bridge*. It means, that two brokers can be connected to each other and share messages. The window of bridge parameters are presented below. There are some mandatory parameters, like *Connection Name*, *Remote Address* and *Remote Port*. Although connection name is mandatory, it should be set to value what you like and according to mosquitto's user manual this option denotes the client ID which will be used when connecting to remote broker. There are some other parameters. If you would like to know that they mean and how to use them you should check for mosquitto.conf manual page.

The last section of parameters is called *Miscellaneous*. It contains parameters, which does not depend on neither *Security*, nor *Bridge* categories. *ACL File* denotes access control list file name. The contents of this file are used to control client access to topics of the broker. The *Password File* denotes the file, there users and corresponding passwords are stored. This file is used for user authentication. This option is related to another option called *Allow Anonymous*. If *Allow Anonymous* is unchecked, only users, which exist in password file will be able to connect to the broker. More about password file can be read on mosquitto configuration manual. The last option is called *Persistence*, it allows to save connection, subscription and message data to the disk, otherwise, the data is stored in memory only.

☒

It is possible to configure some sort of MQTT publisher. It is not simple publisher, but publisher, which publishes some system parameters to the broker. The publisher configuration window has few fields, like hostname and port of the broker to connect. Username and password fields are used for authentication. If these fields are left empty, no authentication is performed.

Broker
Publisher

MQTT Publisher

Enable
☒

Hostname

Port

Username

Password

Save

The full list of system parameters, which can be published, are described below.

Parameter name	Parameter description
temperature	Get temperature of the module in 0.1 degrees Celcium
operator	Get current operator's name
signal	Get signal strength in dBm
network	Get current network type (2G, 3G, 4G, etc')

connection	Check if data connection is available
wan	Get WAN's IP address
uptime	Get system uptime in seconds
name	Get router's name
digital1	Get value of digital input no. 1
digital2	Get value of digital input no. 2
analog	Get value of analog input

In order system to work, MQTT broker should be configured in advance. You can use the broker, which is installed inside the router, or the broker in the other location. The publisher operates according to the scheme presented below. In the scheme the client tries to subscribe information about router's uptime. To achieve this multiple commands between client and publisher are being sent.

In general publisher works in such a way: connects to the broker and subscribes to the topics *router/get* and *get/<SERIAL>/command*, there *<SERIAL>* denotes serial number of the router which is currently run publisher. The client then sends message *id* to the topic *router/get*. The following message is received by the publisher, since it is subscribed to that topic. Then the publisher sends response with its serial number to the topic *router/id*. Now the client knows that publisher with some serial number exist. It means, that client can send message with parameter name from the list as a message to the topic *get/<SERIAL>/command* to the broker. The message will be received only by the subscriber, which has the same SERIAL number mentioned in the topic. Now the publisher can send back a response with *router/<SERIAL>/parameter_name* topic and message with a value of requested parameter. It should be noted, that according to MQTT protocol, the topic names are case-sensitive, for example topic *router* is not the same as topic *RoUtEr*.

9.16 Modbus TCP interface

Modbus TCP

Enable ☐

Port

Allow Remote Access ☐

Save

Modbus TCP interface allows the user to set or get some parameters from the router (the parameters, which can be set or get will be described later), like module temperature or signal strength. In other words, Modbus TCP is another manner to control router behavior. To use Modbus TCP capabilities it must be turned on by navigating to Services-Modbus. After “Save” button is pressed, the Modbus daemon will be launched on selected port of the system. Modbus daemon performs as slave, that means, it accepts connection from the master (client) and sends out a response or sets some system related parameter. By the default Modbus will only accept connections through LAN interface. In order to accept connections through WAN interface also, Allow Remote Access must be checked.

To obtain some parameter from the system, the read holding registers command is used. The register number and corresponding system values are described below. Each register contains 2 bytes. For simplification the number of registers for storing numbers is 2, while for storing text information the number of registers is 16.

Required value	Representation	Register number	Number of registers
System uptime	32 bit unsigned integer	1	2
GSM signal strength (dBm)	32 bit integer	2	2
System temperature in 0.1 degrees Celcium	32 bit integer	3	2
System hostname	Text	4	16
GSM operator name	Text	5	16
Router serial number	Text	6	16
Router MAC address	Text	7	16
Router name	Text	8	16
Current SIM card	Text	9	16
Network registration	Text	10	16
Network type	Text	11	16
Digital input 1	32 bit integer	12	2
Digital input 2	32 bit integer	13	2
Current WAN IP address	32 bit unsigned integer	14	2
Analog input	32 bit integer	15	2

The Modbus daemon also supports setting of some system parameters. For this task write holding register command is used. System related parameters and how to use them are described below. The register number refers to the register number where to start write required values. All commands, except “Change APN” accepts only one input parameter. For the APN the number of input registers may vary. The very first byte of APN command denotes a number

of SIM card for which set the APN. This byte should be set to 1 (in order to change APN for SIM card number 1) or to 2 (in order to change APN for SIM card number 2).

Value to set	Description	Register number	Register value
Digital output 1 (on/off)	Change the state of the digital output number 1	1	1/0
Digital output 2 (on/off)	Change the state of the digital output number 2	2	1/0
Switch WiFi (on/off)	Allows to switch WiFi on or off	10	1/0
Switch mobile data connection (on/off)	Turns on or off mobile data connection	11	1/0
Switch SIM card (SIM1, SIM2, SIM1->SIM2 and SIM2->SIM1)	Allows to change SIM card in use, 3 possible options are supported	12	0/1/2
Change APN	Allows to change APN	13	APN code
Reboot	Reboots a router	20	1

Step 3 (LAN)

Next, you are given the chance to configure your LAN and DHCP server options. For a detailed explanation see LAN under Network.

Step 1 - General
Step 2 - Mobile
Step 3 - LAN
Step 4 - WiFi

Step - LAN

Here we will setup the basic settings of a typical LAN configuration. The wizard will cover 2 basic configurations: static IP address LAN and DHCP client.

General Configuration

IP address
192.168.1.1

Netmask
255.255.255.0

Enable DHCP
☒

Start
100

Limit

Skip Wizard
Save

Step 4 (Wi-Fi)

The final step allows you to configure your wireless settings in order to set up a rudimentary Access Point.

Step 1 - General
Step 2 - Mobile
Step 3 - LAN
Step 4 - WiFi

Step - Wireless

Now let's configure your wireless radio. (Note: if you are currently connecting via wireless and you change parameters, like SSID, encryption, etc. your connection will be dropped and you will have to reconnect with a new set of parameters.)

WiFi Configuration

Enable wireless ☒

Restore to default

	Field name	Explanation
1.	Router name	Enter your new router name.
2.	Host name	Enter your new host name
3.	New Password	Enter your new administration password. Changing this password will change SSH password as well.
4.	Confirm new password	Re-enter your new administration password.
5.	Language	Website will be translated into selected language.
6.	IPv6 support	Enable IPv6 support on router
7.	Show mobile info at login page	Show operator and signal strength at login page.
8.	Show WAN IP at login page	Show WAN IP at login page.
9	On/Off LEDs	If uncheck, all routers LEDs are off.
10	Restore to default	Router will be set to factory default settings

Important notes:

The only way to gain access to the web management if you forget the administrator password is to reset the device factory default settings. Default administrator login settings are:

User Name: **admin**

Password: **admin01**

10.3.2 Troubleshoot

The screenshot shows the 'Troubleshoot Settings' page. It features a navigation bar with tabs: General, Troubleshoot, Backup, Access Control, and Diagnostics. The 'Troubleshoot' tab is active. Below the title 'Troubleshoot Settings', there is a section titled 'Troubleshoot'. This section contains several configuration options: 'System log level' is a dropdown menu set to 'Debug'; 'Save log in' is a dropdown menu set to 'RAM memory'; 'Include GSMD information' is a checked checkbox; 'Include PPPD information' is an unchecked checkbox; 'Include chat script information' is a checked checkbox; and 'Include network topology information' is an unchecked checkbox. At the bottom of the section, there are three buttons: 'Show' for 'System log', 'Show' for 'Kernel log', and 'Download' for 'Troubleshoot file'.

	Field name	Explanation
1.	System log level	Debug level should always be used, unless instructed otherwise.
2.	Save log in	Default RAM memory should always be used unless instructed otherwise.
3.	Include GSMD information	Default setting – enabled should be used, unless instructed otherwise.
4.	Include PPPD information	Default setting – disabled should be used, unless instructed otherwise.
5.	Include Chat script information	Default setting – enabled should be used, unless instructed otherwise.
6.	Include network topology information	Default setting – disabled should be used, unless instructed otherwise.
7.	System Log	Provides on-screen System logging information. It does not, however, substitute troubleshooting file that can be downloaded from System -> Backup and Firmware menu.
8.	Kernel Log	Provides on-screen Kernel logging information. It does not, however, substitute troubleshooting file that can be downloaded from System -> Backup and Firmware menu.
9.	Troubleshoot file	Downloadable archive, that contains full router configuration and all System log files.

Action

	Field name	Explanation
1.	Host	Enter server IP address or hostname.

2.	Ping	Utility used to test the reach ability of a host on an Internet IP network and to measure the round-trip time for messages sent from the originating host to a destination server. Server echo response will be shown after few seconds if server is accessible.
3.	Traceroute	Diagnostics tool for displaying the route (path) and measuring transit delays of packets across an Internet IP network. Log containing route information will be shown after few seconds.
4.	Nslookup	Network administration command-line tool for querying the Domain Name System (DNS) to obtain domain name or IP address mapping or for any other specific DNS record. Log containing specified server DNS lookup information will be shown after few seconds.

10.3.7 Monitoring

Monitoring functionality allows your router to be connected to Remote Monitoring System. Also MAC address and router serial numbers are displayed for convenience in this page, because they are needed when adding device to monitoring system.

	Field name	Explanation
1.	Enable remote monitoring	Check box to enable/disable remote monitoring
2.	Monitoring	Shows monitoring status.
3.	Router LAN MAC address	MAC address of the Ethernet LAN ports
4.	Router serial number	Serial number of the device

10.4 User scripts

Advanced users can insert their own commands that will be executed at the end of booting process.

Startup Script Management

Insert your own commands to execute at the end of the boot process.

```
# Put your custom commands here that should be executed once
# the system init finished. By default this file does nothing.

exit 0
```

Upload script file No file selected.

Backup script file

In *Script Management* window is shown content of a file `/etc/rc.local`. This file is executed at the end of startup, executing the line: `sh /etc/rc.local` In this script is needed to use `sh` (ash) commands. It should be noted, that this is embedded device and `sh` functionality is not full.

10.5 Restore point

Upgrade from file

Firmware image file

Browse...

No file selected.

Upgrade

Keep all settings – if the check box is selected router will keep saved user configuration settings after firmware upgrade. When check box is not selected all router settings will be restored to factory defaults after firmware upgrade. When upgrading firmware, you can choose settings that you wish to keep after the upgrade. This function is useful when firmware is being upgraded via Internet (remotely) and you must not lose connection to the router afterwards.

FW image – router firmware upgrade file.

Warning: Never remove router power supply and do not press reset button during upgrade process! This would seriously damage your router and make it inaccessible. If you have any problems related to firmware upgrade you should always consult with local dealer.

10.6.2 FOTA

Enable auto check

☒

Auto check mode

On router startup

WAN wired

☐

	Field name	Explanation
1.	Server address	Specify server address to check for firmware updates. E.g. "http://teltonika.sritis.it/rut9xx_auto_update/clients/"
2.	User name	User name for server authorization.
3.	Password	Password name for server authorization.
4.	Enable auto check	Check box to enable automatic checking for new firmware updates.
5.	Auto check mode	Select when to perform auto check function.
6.	WAN wired	Allows to update firmware from server only if routers WAN is wired (if box is checked).

10.7 Reboot

Router reboot

Warning! During reboot you will temporarily lose the connection.

Reboot

Reboot router by pressing button "Reboot".

11 Device Recovery

The following section describes available options for recovery of malfunctioning device. Usually device can become unreachable due to power failure during firmware upgrade or if its core files were wrongly modified in the file system. Teltonika's routers offer several options for recovering from these situations.

11.1 Reset button

Reset button is located on the back panel of the device. Reset button has several functions:

Reboot the device. After the device has started and if the reset button is pressed for up to 4 seconds the device will reboot. Start of the reboot will be indicated by flashing of all 5 signal strength LEDs together with green connection status LED.

Reset to defaults. After the device has started if the reset button is pressed for at least 5 seconds the device will reset all user changes to factory defaults and reboot. To help user to determine how long the reset button should be pressed, signal strength LEDs indicates the elapsed time. All 5 lit LEDs means that 5 seconds have passed and reset button can be released. Start of the reset to defaults will be indicated by flashing of all 5 signal strength LEDs together with red connection status LED. SIM PIN on the main SIM card is the only user parameter that is kept after reset to defaults.

11.2 Bootloader's WebUI

Bootloader also provides a way to recover the router functionality when the firmware is damaged. To make it easier to use bootloader has its own webserver that can be accessed with any web browser.

Procedure for starting bootloader's webserver:

Automatically. It happens when bootloader does not detect master firmware. Flashing all 4 Ethernet LEDs indicate that bootloader's webserver has started.

Manually. Bootloader's webserver can be requested by holding reset button for 3 seconds while powering the device on. Flashing all 4 Ethernet LEDs indicates that bootloader's webserver has started.

Bootloader's WebUI can be accessed by typing this address in the web browser:

<http://192.168.1.1/index.html>

Note: it may be necessary to clear web browser's cache and to use incognito/anonymous window to access bootloader's WebUI.

12 Glossary

WAN – Wide Area Network is a telecommunication network that covers a broad area (i.e., any network that links across metropolitan, regional, or national boundaries). Here we use the term WAN to mean the external network that the router uses to reach the internet.

LAN – A local area network (LAN) is a computer network that interconnects computers in a limited area such as a home, school, computer laboratory, or office building.

DHCP – The Dynamic Host Configuration Protocol (DHCP) is a network configuration protocol for hosts on Internet Protocol (IP) networks. Computers that are connected to IP networks must be configured before they can communicate with other hosts. The most essential information needed is an IP address, and a default route and routing prefix. DHCP eliminates the manual task by a network administrator. It also provides a central database of devices that are connected to the network and eliminates duplicate resource assignments.

ETHERNET CABLE – Refers to the CAT5 UTP cable with an RJ-45 connector.

AP – Access point. An access point is any device that provides wireless connectivity for wireless clients. In this case, when you enable Wi-Fi on your router, your router becomes an access point.

DNS – Domain Name System. A server that translates names such as www.google.it to their respective IPs. In order for your computer or router to communicate with some external server it needs to know it's IP, its name "www.something.com" just won't do. There are special servers set in place that perform this specific task of resolving names into IPs, called Domain Name servers. If you have no DNS specified you can still browse the web, provided that you know the IP of the website you are trying to reach.

ARP – Short for Address Resolution Protocol a network layer protocol used to convert an IP address into a physical address (called a *DLC address*), such as an Ethernet address.

PPPoE – Point-to-Point Protocol over Ethernet. PPPoE is a specification for connecting the users on an Ethernet to the internet through a common broadband medium, such as DSL line, wireless device or cable modem.

DSL – digital subscriber line - it is a family of technologies that provide internet access by transmitting digital data using a local telephone network which uses the public switched telephone network.

NAT – network address translation – an internet standard that enables a local-area network (LAN) to use one set of IP addresses for internet traffic and a second set of addresses for external traffic.

LCP – Link Control Protocol – a protocol that is part of the PPP (Point-to-Point Protocol). The LCP checks the identity of the linked device and either accepts or rejects the peer device, determines the acceptable packet size for transmission, searches for errors in configuration and can terminate the link if the parameters are not satisfied.

BOOTP – Bootstrap Protocol – an internet protocol that enables a diskless workstation to discover its own IP address, the IP address of a BOOTP server on the network, and a file to be loaded into memory to boot the machine. This enables the workstation to boot without requiring a hard or floppy disk drive.

TCP – Transmission Control Protocol – one of the main protocols in TCP/IP networks. Whereas the IP protocol deals only with packets, TCP enables two hosts to establish a connection and exchange streams of data. TCP guarantees delivery of data and also guarantees that packets will be delivered in the same order in which they were sent.

TKIP – Temporal Key Integrity Protocol – scrambles the keys using hashing algorithm and, by adding an integrity-checking feature, ensure that the keys haven't been tampered with.

CCMP – Counter Mode Cipher Block Chaining Message Authentication Code Protocol – encryption protocol designed for Wireless LAN products that implement the standards of the IEEE 802.11i amendment to the original IEEE802.11 standard. CCMP is an encrypted data cryptographic encapsulation designed for data confidentiality and based upon the Counter Mode with CBC-MAC (CCM) of the AES (Advanced Encryption Standard) standard.

MAC – Media Access Control. Hardware address which uniquely identifies each node of the network. In IEEE 802 networks, the Data Link Control (DCL) layer of the ISO Reference Model is divided into two sub-layers: the Logical Link Control (LLC) layer and the Media Access Control layer. The MAC layer interfaces directly with the network medium. Consequently, each different type of network medium requires a different MAC layer.

DMZ – Demilitarized Zone – a computer or small subnetwork that sits between a trusted internal network, such as a corporate private LAN, and an untrusted external network, such as the public internet.

UDP – User Datagram Protocol – a connectionless protocol that, like TCP, runs on top of IP networks. Provides very few error recovery services, offering instead a direct way to send and receive datagrams over IP network.

VPN – Virtual Private Network – a network that is constructed by using public wires — usually the Internet — to connect to a private network, such as a company's internal network.

VRRP – Virtual Router Redundancy Protocol - an election protocol that dynamically assigns responsibility for one or more virtual router(s) to the VRRP router(s) on a LAN, allow several routers on a multiaccess link to utilize the same virtual IP address.

GRE Tunnel – Generic Routing Encapsulation - a tunneling protocol developed by Cisco Systems that can encapsulate a wide variety of network layer protocols inside virtual point-to-point links over an Internet Protocol internetwork.

PPPD – Point to Point Protocol Daemon – it is used to manage network connections between two nodes on Unix-like operating systems. It is configured using command-line arguments and configuration files.

SSH – Secure Shell - a program to log into another computer over a network, to execute commands in a remote machine, and to move files from one machine to another. It provides strong authentication and secure communications over insecure channels.

VRRPD – Virtual Router Redundancy Protocol – it is designed to eliminate the single point of failure associated with statically routed networks by automatically providing failover using multiple LAN paths through alternate routers.

SNMP – Simple Network Management Protocol - a set of protocols for managing complex networks. SNMP works by sending messages, called *protocol data units (PDUs)*, to different parts of a network.
