Test Facility

The Test site used by China Certification ICT Co., Ltd (Dongguan) to collect test data is located on the No. 113, Pingkang Road, Dalang Town, Dongguan, Guangdong, China.

The lab has been recognized as the FCC accredited lab under the KDB 974614 D01 and is listed in the FCC Public Access Link (PAL) database, FCC Registration No. : 442868, the FCC Designation No. : CN1314.

Declarations

China Certification ICT Co., Ltd (Dongguan) is not responsible for the authenticity of any test data provided by the applicant. Data included from the applicant that may affect test results are marked with a triangle symbol "▲". Customer model name, addresses, names, trademarks etc. are not considered data.

Unless otherwise stated the results shown in this test report refer only to the sample(s) tested.

This report cannot be reproduced except in full, without prior written approval of the Company.

This report is valid only with a valid digital signature. The digital signature may be available only under the Adobe software above version 7.0.

This report may contain data that are not covered by the accreditation scope and shall be marked with an asterisk " \star ".

Each test item follows the test standard(s) without deviation.

1.2 Test Specification, Methods and Procedures

The tests documented in this report were performed in accordance with FCC 47 CFR § 2.1093, IEEE 1528-2013, the following FCC Published RF exposure KDB procedures:

KDB 447498 D01 General RF Exposure Guidance v06 KDB 865664 D01 SAR Measurement 100 MHz to 6 GHz v01r04 KDB 865664 D02 RF Exposure Reporting v01r02 KDB 941225 D01 3G SAR Procedures v03r01 KDB 941225 D05 SAR for LTE Devices v02r05 KDB 248227 D01 802.11 Wi-Fi SAR v02r02

TCB Workshop April 2019: RF Exposure Procedures

1.3 SAR Limits

FCC Limit

| | SAR (| W/kg) |
|--|--|--|
| EXPOSURE LIMITS | (General Population / Uncontrolled Exposure Environment) | (Occupational / Controlled Exposure Environment) |
| Spatial Average (averaged over the whole body) | 0.08 | 0.4 |
| Spatial Peak (averaged over any 1 g of tissue) | 1.60 | 8.0 |
| Spatial Peak (hands/wrists/feet/ankles averaged over 10 g) | 4.0 | 20.0 |

Population/Uncontrolled Environments are defined as locations where there is the exposure of individual who have no knowledge or control of their exposure.

Occupational/Controlled Environments are defined as locations where there is exposure that may be incurred by people who are aware of the potential for exposure (i.e. as a result of employment or occupation).

General Population/Uncontrolled environments Spatial Peak limit 1.6W/kg for 1g Head(Face Up) SAR and limit 4.0W/kg for 10g Extremity SAR applied to the EUT.

2. SAR MEASUREMENT SYSTEM

These measurements were performed with the automated near-field scanning system DASY5 from Schmid & Partner Engineering AG (SPEAG) which is the Fifth generation of the system shown in the figure hereinafter:

DASY5 System Description

The DASY5 system for performing compliance tests consists of the following items:

- A standard high precision 6-axis robot with controller, teach pendant and software. An arm extension for accommodating the data acquisition electronics (DAE).
- An isotropic field probe optimized and calibrated for the targeted measurement.
- A data acquisition electronics (DAE) which performs the signal application, signal multiplexing, ADconversion, offset measurements, mechanical surface detection, collision detection, etc. The unit is battery powered with standard or rechargeable batteries. The signal is optically transmitted to the EOC.
- The Electro-optical converter (EOC) performs the conversion from optical to electrical signals for the digital communication to the DAE. To use optical surface detection, a special version of the EOC is required. The EOC signal is transmitted to the measurement server.
- The function of the measurement server is to perform the time critical tasks such as signal filtering, control of the robot operation and fast movement interrupts.
- The Light Beam used is for probe alignment. This improves the (absolute) accuracy of the probe positioning.
- A computer running Win7 professional operating system and the DASY52 software.
- Remote control and teach pendant as well as additional circuitry for robot safety such as warning lamps, etc.
- The phantom, the device holder and other accessories according to the targeted measurement.

DASY5 Measurement Server

The DASY5 measurement server is based on a PC/104 CPU board with a 400MHz Intel ULV Celeron, 128MB chip-disk and 128MB RAM. The necessary circuits for communication with the DAE4 (or DAE3) electronics box, as well as the 16 bit AD-converter system for optical detection and digital I/O interface are contained on the DASY5 I/O board, which is directly connected to the PC/104 bus of the CPU board.

The measurement server performs all real-time data evaluation of field measurements and surface detection, controls robot movements and handles safety operation. The PC operating system cannot interfere with these time critical

processes. All connections are supervised by a watchdog, and disconnection of any of the cables to the measurement server will automatically disarm the robot and disable all program-controlled robot movements. Furthermore, the measurement server is equipped with an expansion port which is reserved for future applications. Please note that this expansion port does not have a standardized point out, and therefore only devices provided by SPEAG can be connected. Devices from any other supplier could seriously damage the measurement server.

Data Acquisition Electronics

The data acquisition electronics (DAE4) consist of a highly sensitive electrometer-grade preamplifier with auto-zeroing, a channel and gain-switching multiplexer, a fast 16 bit AD-converter and a command decoder with a control logic unit. Transmission to the measurement server is accomplished through an optical downlink for data and status information, as well as an optical uplink for commands and the clock.

The mechanical probe mounting device includes two different sensor systems for frontal and sideways probe contacts. They are used for mechanical surface detection and probe collision detection.

The input impedance of both the DAE4 as well as of the DAE3 box is 200MOhm; the inputs are symmetrical and floating. Common mode rejection is above 80 dB.

EX3DV4 E-Field Probes

| Frequency | 10 MHz to > 6 GHz Linearity: ± 0.2 dB (30 MHz to 6 GHz) |
|------------------|---|
| Directivity | \pm 0.3 dB in TSL (rotation around probe axis) \pm 0.5 dB in TSL (rotation normal to probe axis) |
| Dynamic Range | 10 μ W/g to > 100 mW/g Linearity: ± 0.2 dB (noise: typically < 1 μ W/g) |
| Dimensions | Overall length: 337 mm (Tip: 20 mm) Tip diameter: 2.5 mm (Body: 12 mm) Typical distance from probe tip to dipole centers: 1 mm |
| Application | High precision dosimetric measurements in any exposure scenario (e.g., very strong gradient fields); the only probe that enables compliance testing for frequencies up to 6 GHz with precision of better 30%. |
| Compatibility | DASY3, DASY4, DASY52 SAR and higher, EASY4/MRI |

SAM Twin Phantom

The SAM twin phantom is a fiberglass shell phantom with 2mm shell thickness (except the ear region, where shell thickness increases to 6 mm). The phantom has three measurement areas:

- _ Left Head
- Right Head
- Flat phantom

The phantom table for the DASY systems based on the robots have the size of $100 \times 50 \times 85$ cm (L x W x H). For easy dislocation these tables have fork lift cut outs at the bottom.

The bottom plate contains three pairs of bolts for locking the device holder. The device holder positions are adjusted to the

standard measurement positions in the three sections. Only one device holder is necessary if two phantoms are used (e.g., for different liquids)

A white cover is provided to cover the phantom during off-periods to prevent water evaporation and changes in the liquid parameters. Free space scans of devices on top of this phantom cover are possible. Three reference marks are provided on the phantom counter. These reference marks are used to teach the absolute phantom position relative to the robot.

Robots

The DASY5 system uses the high precision industrial robot. The robot offers the same features important for our application:

- High precision (repeatability 0.02mm)
- High reliability (industrial design)
- Low maintenance costs (virtually maintenance free due to direct drive gears; no belt drives)
- Jerk-free straight movements (brushless synchrony motors; no stepper motors)
- Low ELF interference (motor control fields shielded via the closed metallic construction shields)

The above mentioned robots are controlled by the Staubli CS8c robot controllers. All information regarding the use and maintenance of the robot arm and the robot controller is contained on the CDs delivered along with the robot. Paper manuals are available upon request direct from Staubli.

SAR Scan Procedures

Step 1: Power Reference Measurement

The Power Reference Measurement and Power Drift Measurements are for monitoring the power drift of the device under test in the batch process. The minimum distance of probe sensors to surface determines the closest measurement point to phantom surface. The minimum distance of probe sensors to surface is 1.4 mm. This distance cannot be smaller than the distance of sensor calibration points to probe tip as defined in the probe properties.

Step 2: Area Scans

Area scans are defined prior to the measurement process being executed with a user defined variable spacing between each measurement point (integral) allowing low uncertainty measurements to be conducted. Scans defined for FCC applications utilize a 15mm 2 step integral, with 1.5mm interpolation used to locate the peak SAR area used for zoom scan assessments.

Where the system identifies multiple SAR peaks (which are within 25% of peak value) the system will provide the user with the option of assessing each peak location individually for zoom scan averaging.

| Area Scan Parameters extracted from KDB 865664 D01 SAR Measurement 100 MHz to 6 GHz |
|---|
|---|

| | \leq 3 GHz | > 3 GHz |
|--|--|---|
| Maximum distance from closest measurement point (geometric center of probe sensors) to phantom surface | $5 \text{ mm} \pm 1 \text{ mm}$ | $\frac{1}{2} \cdot \delta \cdot \ln(2) \text{ mm} \pm 0.5 \text{ mm}$ |
| Maximum probe angle from probe axis to phantom surface normal at the measurement location | $30^{\circ} \pm 1^{\circ}$ | $20^{\circ} \pm 1^{\circ}$ |
| | ≤ 2 GHz: ≤ 15 mm 2 - 3 GHz: ≤ 12 mm | 3 – 4 GHz: ≤ 12 mm 4 – 6 GHz: ≤ 10 mm |
| Maximum area scan spatial resolution: Δx_{Area} , Δy_{Area} | When the x or y dimension measurement plane orientat above, the measurement res corresponding x or y dimen at least one measurement po | ion, is smaller than the olution must be ≤ the sion of the test device with |

Step 3: Zoom Scan (Cube Scan Averaging)

The averaging zoom scan volume utilized in the DASY5 software is in the shape of a cube and the side dimension of a 1 g or 10 g mass is dependent on the density of the liquid representing the simulated tissue. A density of 1000 kg/m^3 is used to represent the head and body tissue density and not the phantom liquid density, in order to be consistent with the definition of the liquid dielectric properties, i.e. the side length of the 1g cube is 10mm, with the side length of the 10g cube is 21.5mm.

| | | | \leq 3 GHz | > 3 GHz |
|--|---|--|---|--|
| Maximum zoom scan | spatial res | olution: Δx _{Zoom} , Δy _{Zoom} | $\leq 2 \text{ GHz:} \leq 8 \text{ mm}$ 2 - 3 GHz: $\leq 5 \text{ mm}^*$ | 3 – 4 GHz: ≤ 5 mm* 4 – 6 GHz: ≤ 4 mm* |
| | uniform | grid: ∆z _{Zoom} (n) | ≤ 5 mm | 3 - 4 GHz: ≤ 4 mm 4 - 5 GHz: ≤ 3 mm 5 - 6 GHz: ≤ 2 mm |
| Maximum zoom scan spatial resolution, normal to phantom surface | $\begin{array}{c} \mbox{graded} \\ \mbox{grid} \end{array} \begin{array}{c} \Delta z_{Zoom}(1): \mbox{ between } \\ 1^{st} \mbox{ two points closest} \\ \mbox{to phantom surface} \\ \hline \Delta z_{Zoom}(n \geq 1): \\ \mbox{ between subsequent} \\ \mbox{points} \end{array}$ | | \leq 4 mm | $3-4$ GHz: ≤ 3 mm $4-5$ GHz: ≤ 2.5 mm $5-6$ GHz: ≤ 2 mm |
| | | | $\leq 1.5 \cdot \Delta z_{Zoom}(n-1) mm$ | |
| Minimum zoom scan volume | x, y, z | | ≥ 30 mm | 3 – 4 GHz: ≥ 28 mm 4 – 5 GHz: ≥ 25 mm 5 – 6 GHz: ≥ 22 mm |

Zoom Scan Parameters extracted from KDB 865664 D01 SAR Measurement 100 MHz to 6 GHz

Note: δ is the penetration depth of a plane-wave at normal incidence to the tissue medium; see IEEE Std 1528-2013 for details.

When zoom scan is required and the <u>reported</u> SAR from the area scan based 1-g SAR estimation procedures of KDB Publication 447498 is ≤ 1.4 W/kg, ≤ 8 mm, ≤ 7 mm and ≤ 5 mm zoom scan resolution may be applied, respectively, for 2 GHz to 3 GHz, 3 GHz to 4 GHz and 4 GHz to 6 GHz.

Step 4: Power Drift Measurement

The Power Drift Measurement measures the field at the same location as the most recent power reference measurement within the same procedure, and with the same settings. The Power Drift Measurement gives the field difference in dB from the reading conducted within the last Power Reference Measurement. This allows a user to monitor the power drift of the device under test within a batch process. The measurement procedure is the same as Step 1.

When the cube intersects with the surface of the phantom, it is oriented so that 3 vertices touch the surface of the shell or the center of a face is tangent to the surface. The face of the cube closest to the surface is modified in order to conform to the tangent surface.

The zoom scan integer steps can be user defined so as to reduce uncertainty, but normal practice for typical test applications (including FCC) utilize a physical step of 7 x7 x 7 (5mmx5mmx5mm) providing a volume of 30 mm in the X & Y & Z axis.

Tissue Dielectric Parameters for Head and Body Phantoms

The head tissue dielectric parameters recommended by the IEC 62209-1:2016

Recommended Tissue Dielectric Parameters for Head liquid

Table A.3 – Dielectric properties of the head tissue-equivalent liquid

| Frequency | Relative permittivity | Conductivity (a) |

4.2 System Accuracy Verification

Prior to the assessment, the system validation kit was used to test whether the system was operating within its specifications of $\pm 10\%$. The validation results are tabulated below. And also the corresponding SAR plot is attached as well in the SAR plots files.

The spacing distances in the System Verification Setup Block Diagram is given by the following:

- a) $s = 15 \text{ mm} \pm 0.2 \text{ mm}$ for 300 MHz $\leq f \leq 1 000 \text{ MHz}$;
- b) $s = 10 \text{ mm} \pm 0.2 \text{ mm}$ for 1 000 MHz < f \leq 3 000 MHz;
- c) s = 10 mm \pm 0,2 mm for 3 000 MHz \leq f \leq 6 000 MHz.

4.3 SAR SYSTEM VALIDATION DATA

System Performance 750 MHz Head was performed on 2024/09/21

DUT: D750V3; Type: 750 MHz; Serial: 1230

Communication System: CW (0); Frequency: 750 MHz;Duty Cycle: 1:1 Medium parameters used: f = 750 MHz; σ = 0.892 S/m; ϵ_r =42.955; ρ = 1000 kg/m³; Phantom section: Flat Section

DASY5 Configuration:

- Probe: EX3DV4 SN7329; ConvF(8.79, 10.07, 9.05)@ 750 MHz; Calibrated: 2024/3/27
- Sensor-Surface: 1.4mm (Mechanical Surface Detection)
- Electronics: DAE4 Sn1354; Calibrated: 2023/11/17
- Phantom: Twin SAM; Type: Twin SAM V5.0; Serial: TP:1412
- Measurement SW: DASY52, Version 52.10 (2); SEMCAD X Version 14.6.12 (7470)

Area Scan(7x13x1):Measurement grid: dx=15mm, dy=15mm Maximum value of SAR (measured) = 0.940 W/kg

Zoom Scan (5x5x7)/Cube 0: Measurement grid: dx=8mm, dy=8mm, dz=5mm Reference Value = 30.86 V/m; Power Drift = 0.17 dB Peak SAR (extrapolated) = 1.26 W/kg SAR(1 g) = 0.833 W/kg; SAR(10 g) = 0.546 W/kg Maximum value of SAR (measured) = 0.978 W/kg

System Performance 900 MHz Head was performed on 2024/09/21

DUT: D900V2; Type: 900 MHz; Serial: 1d217

Communication System: CW; Frequency: 900 MHz;Duty Cycle: 1:1 Medium parameters used: f = 900 MHz; σ = 0.951 S/m; ϵ_r = 42.084; ρ = 1000 kg/m³ Phantom section: Flat Section

DASY5 Configuration:

- Probe: EX3DV4 SN7329; ConvF(8.42, 9.5, 8.93)@ 900 MHz; Calibrated: 2024/3/27
- Sensor-Surface: 1.4mm (Mechanical Surface Detection)
- Electronics: DAE4 Sn1354; Calibrated: 2023/11/17
- Phantom: Twin SAM; Type: Twin SAM V5.0; Serial: TP:1412
- Measurement SW: DASY52, Version 52.10 (2); SEMCAD X Version 14.6.12 (7470)

Area Scan (6x11x1): Measurement grid: dx=15mm, dy=15mm Maximum value of SAR (measured) = 1.30 W/kg

Zoom Scan (5x5x7)/Cube 0: Measurement grid: dx=8mm, dy=8mm, dz=5mm Reference Value = 40.06 V/m; Power Drift = -0.19 dB Peak SAR (extrapolated) = 1.78 W/kg SAR(1 g) = 1.12 W/kg; SAR(10 g) = 0.711 W/kg Maximum value of SAR (measured) = 1.33 W/kg

System Performance 1750MHz Head was performed on 2024/09/21

DUT: D1900V2; Type: 1750 MHz; Serial: 1200

Communication System: CW; Frequency: 1750 MHz;Duty Cycle: 1:1 Medium parameters used: f = 1750 MHz; σ = 1.356 S/m; ϵ_r = 41.203; ρ = 1000 kg/m³ Phantom section: Flat Section

DASY5 Configuration:

- Probe: EX3DV4 SN7329; ConvF(7.56, 8.56, 7.71)@ 1750 MHz; Calibrated: 2024/3/27
- Sensor-Surface: 1.4mm (Mechanical Surface Detection)
- Electronics: DAE4 Sn1354; Calibrated: 2023/11/17
- Phantom: Twin SAM; Type: Twin SAM V5.0; Serial: TP:1412
- Measurement SW: DASY52, Version 52.10 (2); SEMCAD X Version 14.6.12 (7470)

Area Scan(5x7x1):Measurement grid: dx=15mm, dy=15mm Maximum value of SAR (measured) = 4.19 W/kg

Zoom Scan (7x7x7)/Cube 0: Measurement grid: dx=5mm, dy=5mm, dz=5mm Reference Value = 52.34 V/m; Power Drift = 0.11 dB Peak SAR (extrapolated) = 6.59 W/kg SAR(1 g) = 3.65 W/kg; SAR(10 g) = 1.94 W/kg Maximum value of SAR (measured) = 4.62 W/kg

0 dB = 4.62 W/kg = 6.65 dBW/kg

System Performance 1900MHz Head was performed on 2024/09/22

DUT: D1900V2; Type: 1900 MHz; Serial: 5d251

Communication System: CW; Frequency: 1900 MHz;Duty Cycle: 1:1 Medium parameters used: f = 1900 MHz; σ = 1.415 S/m; ϵ_r = 40.164; ρ = 1000 kg/m³ Phantom section: Flat Section

DASY5 Configuration:

- Probe: EX3DV4 SN7329; ConvF(7.37, 8.32, 7.54)@ 1900 MHz; Calibrated: 2024/3/27
- Sensor-Surface: 1.4mm (Mechanical Surface Detection)
- Electronics: DAE4 Sn1354; Calibrated: 2023/11/17
- Phantom: Twin SAM; Type: Twin SAM V5.0; Serial: TP:1412
- Measurement SW: DASY52, Version 52.10 (2); SEMCAD X Version 14.6.12 (7470)

Area Scan(7x8x1):Measurement grid: dx=15mm, dy=15mm Maximum value of SAR (measured) = 5.30 W/kg

Zoom Scan (5x5x7)/Cube 0: Measurement grid: dx=8mm, dy=8mm, dz=5mm Reference Value = 62.16 V/m; Power Drift = -0.16 dB Peak SAR (extrapolated) = 6.05 W/kg SAR(1 g) = 4.02 W/kg; SAR(10 g) = 2.14 W/kg Maximum value of SAR (measured) = 5.27 W/kg

System Performance 2600MHzHead was performed on 2024/09/22

DUT: D2600V2; Type: 2600 MHz; Serial: 1206

Communication System: CW; Frequency: 2600 MHz;Duty Cycle: 1:1 Medium parameters used: f = 2600 MHz; σ = 2.038 S/m; ϵ_r = 38.127; ρ = 1000 kg/m³ Phantom section: Flat Section

DASY5 Configuration:

- Probe: EX3DV4 SN7329; ConvF(6.91, 7.77, 7.08) @ 2600 MHz; Calibrated: 2024/3/27
- Sensor-Surface: 1.4mm (Mechanical Surface Detection)
- Electronics: DAE4 Sn1354; Calibrated: 2023/11/17
- Phantom: Twin SAM; Type: Twin SAM V5.0; Serial: TP:1412
- Measurement SW: DASY52, Version 52.10 (2); SEMCAD X Version 14.6.12 (7470)

Area Scan (6x9x1):Measurement grid: dx=12 mm, dy=12mm Maximum value of SAR (measured) = 7.21 W/kg

```
Zoom Scan (7x7x7)/Cube 0: Measurement grid: dx=5mm, dy=5mm, dz=5mm
Reference Value = 57.68 V/m; Power Drift = 0.01 dB
Peak SAR (extrapolated) = 12.3 W/kg
SAR(1 g) = 5.71 W/kg; SAR(10 g) = 2.56 W/kg
Maximum value of SAR (measured) = 7.52 W/kg
```

0 dB = 7.52 W/kg = 8.76 dBW/kg

5. EUT TEST STRATEGY AND METHODOLOGY

5.1 Front-of-face and Limbs

Transmitters that are built-in within a wrist watch or similar wrist-worn devices typically operatein speaker mode for voice communication, with the device worn on the wrist and positioned next to the mouth. Next to the mouth exposure requires 1-g SAR and the wrist-worn condition requires 10-g extremity SAR. The 10-g extremity and 1-g SAR test exclusions may be applied to the wrist and face exposure conditions. When SAR evaluation is required, next to the mouth use is evaluated with the front of the device positioned at 10 mm from a flat phantom filled with head tissue-equivalent medium. The wrist bands should be strapped to gether to represent normal use conditions. SAR for wrist exposure is evaluated with the back of the device positioned in direct contact against a flat phantom filled with body tissue-equivalent medium. The wrist bands should be unstrapped and touching the phantom. The space introduced by the watch or wrist bands and the phantom must be representative of actual use conditions.

5.2 Test Distance for SAR Evaluation

For Face Up mode(1g Head SAR) the EUT is set 10mm away from the phantom, the test distance is 10mm; For Limb Worn mode(10g Extremity SAR) the EUT(Equipment Under Test) is set directly against the phantom, the test distance is 0mm.

5.3 SAR Evaluation Procedure

The evaluation was performed with the following procedure:

Step 1: Measurement of the SAR value at a fixed location above the ear point or central position was used as a reference value for assessing the power drop. The SAR at this point is measured at the start of the test and then again at the end of the testing.

Step 2: The SAR distribution at the exposed side of the head was measured at a distance of 4 mm from the inner surface of the shell. The area covered the entire dimension of the head or radiating structures of the EUT, the horizontal grid spacing was 15 mm x 15 mm, and the SAR distribution was determined by integrated grid of 1.5mm x 1.5mm. Based on these data, the area of the maximum absorption was determined by spline interpolation. The first Area Scan covers the entire dimension of the EUT to ensure that the hotspot was correctly identified.

Step 3: Around this point, a volume of 30 mm x 30 mm x 30 mm was assessed by measuring 7x 7 x 7 points. On the basis of this data set, the spatial peak SAR value was evaluated under the following procedure:

1) The data at the surface were extrapolated, since the center of the dipoles is 1.2 mm away from the tip of the probe and the distance between the surface and the lowest measuring point is 1.3 mm. The extrapolation was based on a least square algorithm. A polynomial of the fourth order was calculated through the points in z-axes. This polynomial was then used to evaluate the points between the surface and the probe tip.

2) The maximum interpolated value was searched with a straightforward algorithm. Around this maximum the SAR values averaged over the spatial volumes (1 g or 10 g) were computed by the 3D-Spline interpolation algorithm. The 3D-Spline is composed of three one dimensional splines with the "Not a knot"-condition (in x, y and z-directions). The volume was integrated with the trapezoidal-algorithm. One thousand points ($10 \times 10 \times 10$) were interpolated to calculate the averages.

All neighboring volumes were evaluated until no neighboring volume with a higher average value was found.

Step 4: Re-measurement of the SAR value at the same location as in Step 1. If the value changed by more than 5%, the evaluation was repeated.

6. CONDUCTED OUTPUT POWER MEASUREMENT

6.1 Test Procedure

The RF output of the transmitter was connected to the input of the Wireless Communication Test Set through Connector.

GSM/WCDMA/LTE

The RF output of the transmitter was connected to the input port of the USB Power Sensor through Connector.

WLAN

6.2 Description of Test Configuration

| DPDCH category 7. E-DCH TTI is set to 2ms TTI and E-DCH table index = 2. To support these E-DCH | | | | | | | | | | | |
| configurations DPDCH is not allocated. The UE is signalled to use the extrapolation algorithm. | | | | | | | | | | | |

The following tests were conducted according to the test requirements in Table C.11.1.4 of 3GPP TS 34.121-1

LTE (FDD):

The following tests were conducted according to the test requirements in 3GPP TS36.101

The following tests were conducted according to the test requirements outlined in section 6.2 of the 3GPP TS36.101 specification.

UE Power Class: 3 (23 +/- 2dBm). The allowed Maximum Power Reduction (MPR) for the maximum output power due to higher order modulation and transmit bandwidth configuration (resource blocks) is specified in Table 6.2.3-1 of the 3GPP TS36.101.

Table 6.2.3-1: Maximum Power Reduction (MPR) for Power Class 3

| Modulation | Cha | Channel bandwidth / Transmission bandwidth (RB) | | | | | | | |
|------------|------------|---|----|------|------|------|-----|--|--|
| | 1.4 MHz | | | | | | | | |
| OPSK | > 5 | >4 | >8 | > 12 | > 16 | > 18 | ≤ 1 | | |
| 16 QAM | ≤ 5 | ≤4 | ≤8 | ≤ 12 | ≤ 16 | ≤ 18 | ≤ 1 | | |
| 16 QAM | > 5 | > 4 | >8 | > 12 | > 16 | > 18 | ≤2 | | |

The allowed A-MPR values specified below in Table 6.2.4.-1 of 3GPP TS36.101 are in addition to the allowed MPR requirements. All the measurements below were performed with A-MPR disabled, by using Network Signaling Value of "NS_01".

| Network Signalling value | Requirements (sub-clause) | E-UTRA Band | Channel bandwidth (MHz) | Resources Blocks (N _{RB}) | A-MPR (dB) |

| LTE Band 7 | 24.8 | 24.8 | 24.8 | | | | |
| LTE Band 12 | 24.4 | 24.4 | 24.4 | | | | |
| WLAN 2.4G(802.11b) | 10.1 | 10.1 | 10.1 | | | | |
| WLAN 2.4G(802.11g) | 10.4 | 10.4 | 10.4 | | | | |
| WLAN 2.4G(802.11n ht20) | 10.1 | 10.1 | 10.1 | | | | |

Note: The Maximum Target Power for LTE bands corresponds to their maximumpower in QPSK modes with maximum bandwidth.

6.4 Test Results:

GSM:

| Band | Channel No. | Frequency (MHz) | RF Output Power (dBm) |
|----------|-------------|--------------------|--------------------------|
| GSM 850 | 128 | 824.2 | 33.71 |
| | 190 | 836.6 | 33.92 |
| | 251 | 848.8 | 33.72 |
| PCS 1900 | 512 | 1850.2 | 30.80 |
| | 661 | 1880 | 30.95 |
| | 810 | 1909.8 | 30.77 |

GPRS:

| Band Channel No. | Channel Frequency | | RF Output Power (dBm) | | | | |
|------------------|-------------------|--------|-----------------------|---------|---------|---------|--|
| | No. | (MHz) | 1 slot | 2 slots | 3 slots | 4 slots | |
| | 128 | 824.2 | 33.74 | 31.72 | 29.64 | 27.53 | |
| GSM 850 | 190 | 836.6 | 33.96 | 31.69 | 29.64 | 27.54 | |
| | 251 | 848.8 | 33.91 | 31.78 | 29.63 | 27.44 | |
| | 512 | 1850.2 | 30.44 | 28.36 | 26.84 | 24.77 | |
| PCS 1900 | 661 | 1880 | 30.55 | 28.25 | 26.60 | 24.56 | |
| | 810 | 1909.8 | 30.14 | 28.01 | 26.38 | 24.07 | |

EGPRS:

| Band | Channel | Frequency | requency RF Output Power (dBm) | | | | |
|----------|-----------|-----------|--------------------------------|---------|---------|-------|--|
| | No. (MHz) | 1 slot | 2 slots | 3 slots | 4 slots | | |
| | 128 | 824.2 | 26.92 | 26.49 | 24.71 | 21.74 | |
| GSM 850 | 190 | 836.6 | 26.72 | 26.40 | 25.45 | 22.41 | |
| | 251 | 848.8 | 26.48 | 26.78 | 25.27 | 22.55 | |
| | 512 | 1850.2 | 26.67 | 26.26 | 25.96 | 23.67 | |
| PCS 1900 | 661 | 1880 | 26.64 | 25.97 | 26.02 | 23.89 | |
| | 810 | 1909.8 | 26.57 | 25.85 | 24.22 | 23.63 | |

For SAR, the time based average power is relevant, the difference in between depends on the duty cycle of the TDMA signal.

| Number of Time slot | 1 | 2 | 3 | 4 |
|--|-------|-------|----------|-------|
| Duty Cycle | 1:8 | 1:4 | 1:2.66 | 1:2 |
| Time based Ave. power compared to slotted Ave. power | -9 dB | -6 dB | -4.25 dB | -3 dB |
| Crest Factor | 8 | 4 | 2.66 | 2 |

The time based average power for GPRS

| Band Channel No. | Channel | Channel Frequency | | Time based average Power (dBm) | | | | |
|------------------|---------|-------------------|--------|--------------------------------|---------|---------|--|--|
| | No. | (MHz) | 1 slot | 2 slot | 3 slots | 4 slots | | |
| | 128 | 824.2 | 24.74 | 25.72 | 25.39 | 24.53 | | |
| GSM 850 | 190 | 836.6 | 24.96 | 25.69 | 25.39 | 24.54 | | |
| | 251 | 848.8 | 24.91 | 25.78 | 25.38 | 24.44 | | |
| | 512 | 1850.2 | 21.44 | 22.36 | 22.59 | 21.77 | | |
| PCS 1900 | 661 | 1880 | 21.55 | 22.25 | 22.35 | 21.56 | | |
| | 810 | 1909.8 | 21.14 | 22.01 | 22.13 | 21.07 | | |

The time based average power for EGPRS

| Band Channel No. | Channel | Frequency | Time based average Power (dBm) | | | | |
|------------------|---------|-----------|--------------------------------|--------|---------|---------|--|
| | No. | (MHz) | 1 slot | 2 slot | 3 slots | 4 slots | |
| | 128 | 824.2 | 17.92 | 20.49 | 20.46 | 18.74 | |
| GSM 850 | 190 | 836.6 | 17.72 | 20.4 | 21.2 | 19.41 | |
| | 251 | 848.8 | 17.48 | 20.78 | 21.02 | 19.55 | |
| | 512 | 1850.2 | 17.67 | 20.26 | 21.71 | 20.67 | |
| PCS 1900 | 661 | 1880 | 17.64 | 19.97 | 21.77 | 20.89 | |
| | 810 | 1909.8 | 17.57 | 19.85 | 19.97 | 20.63 | |

Note:

1. Radio Communication Analyzer (MT8820C) was used for the measurement of GSM peak and average output power for active timeslots.

2 .For GSM voice, 1 timeslot has been activated with power level 5 (850 MHz band) and 0 (1900 MHz band).

3 .For GPRS, 1, 2, 3 and 4timeslots has been activated separately with power level 3(850 MHz band) and 3(1900 MHz band).

WCDMA:

WCDMA Band 2:

| Test Mode | Conducted | Average Output P | ower(dBm) |
|-----------------|----------------|------------------|-----------------|
| Test Mode | Lowest Channel | Middle Channel | Highest Channel |
| WCDMA R99 | 23.30 | 23.42 | 23.20 |
| HSDPA Subtest 1 | 22.91 | 22.65 | 22.84 |
| HSDPA Subtest 2 | 22.56 | 22.52 | 22.52 |
| HSDPA Subtest 3 | 22.53 | 22.29 | 22.45 |
| HSDPA Subtest 4 | 22.53 | 22.38 | 22.62 |
| HSUPA Subtest 1 | 22.82 | 21.19 | 21.56 |
| HSUPA Subtest 2 | 22.23 | 22.50 | 22.73 |
| HSUPA Subtest 3 | 21.38 | 21.18 | 21.62 |
| HSUPA Subtest 4 | 22.94 | 22.95 | 22.99 |
| HSUPA Subtest 5 | 21.50 | 21.85 | 21.83 |
| HSPA+ | 20.52 | 20.47 | 20.41 |

WCDMA Band 5:

| Teat Mada | Conducted | Average Output P | ower(dBm) |
|-----------------|----------------|------------------|-----------------|
| Test Mode | Lowest Channel | Middle Channel | Highest Channel |
| WCDMA R99 | 23.20 | 23.21 | 23.26 |
| HSDPA Subtest 1 | 22.04 | 22.02 | 21.98 |
| HSDPA Subtest 2 | 21.79 | 21.68 | 21.96 |
| HSDPA Subtest 3 | 21.53 | 21.36 | 21.63 |
| HSDPA Subtest 4 | 21.52 | 21.41 | 21.66 |
| HSUPA Subtest 1 | 22.60 | 22.91 | 22.93 |
| HSUPA Subtest 2 | 22.73 | 21.20 | 21.90 |
| HSUPA Subtest 3 | 21.27 | 21.03 | 21.45 |
| HSUPA Subtest 4 | 21.94 | 22.19 | 22.25 |
| HSUPA Subtest 5 | 21.14 | 21.14 | 21.17 |
| HSPA+ | 21.17 | 21.19 | 21.11 |

Note:

- 1. The default test configuration is to measure SARwith an established radio link between the EUT and a communication test set using a 12.2 kbps RMC (reference measurement Channel) Configured in Test Loop Model 1.
- 2. KDB 941225 D01-Body SAR is not required for HSDPA/HSUPA/HSPA+ when the maximum average output of each RF channel is less than ¹/₄ dB higher than measured 12.2kbps RMC or the maximum SAR for 12.2kbps RMC is < 75% of SAR limit.

LTE Band 2:

| Test Bandwidth | Test Modulation | Resource Block & RB offset | Target MPR | Meas MPR | Low Channel (dBm) | Middle Channel (dBm) | High Channel (dBm) |

7. Standalone SAR test exclusion considerations

Antennas Location:

7.1 Standalone SAR test exclusion considerations

Face Up

| Mode | Frequency (MHz) | Output Power (dBm) | Output Power (mW) | Distance (mm) | Calculated value | Threshold (1-g) | SAR Test Exclusion |
|-----------|--------------------|--------------------------|-------------------------|------------------|------------------|--------------------|-----------------------|
| WLAN 2.4G | 2462 | 10.4 | 10.96 | 10 | 1.7 | 3.0 | YES |

Limb Worn

| Mode | Frequency (MHz) | Output Power (dBm) | Output Power (mW) | Distance (mm) | Calculated value | Threshold (10-g) | SAR Test Exclusion |
|-----------|--------------------|--------------------------|-------------------------|------------------|------------------|---------------------|-----------------------|
| WLAN 2.4G | 2462 | 10.4 | 10.96 | 0 | 3.4 | 7.5 | YES |

NOTE:

The 1-g and 10-g SAR test exclusion thresholds for 100 MHz to 6 GHz at test separation distances \leq 50 mm are determined by:

[(max. power of channel, including tune-up tolerance, mW)/(min. test separation distance, mm)] ·

 $[\sqrt{f(GHz)}] \le 3.0$ for 1-g SAR and ≤ 7.5 for 10-g extremity SAR, where

1. f(GHz) is the RF channel transmit frequency in GHz.

2. Power and distance are rounded to the nearest mW and mm before calculation.

3. The result is rounded to one decimal place for comparison.

4. When the minimum test separation distance is < 5 mm, a distance of 5 mm is applied to determine SAR test Exclusion.

7.2 Standalone SAR estimation:

Face Up

| Mode | Frequency (MHz) | Output Power (dBm) | Output Power (mW) | Distance (mm) | Estimated 1-g (W/kg) | |
|-----------|--------------------|--------------------------|-------------------------|------------------|-------------------------|--|
| WLAN 2.4G | 2462 | 10.4 | 10.96 | 10 | 0.23 | |

Limb Worn

| Mode | Frequency (MHz) | Output Power (dBm) | Output Power (mW) | Distance (mm) | Estimated 10-g (W/kg) |
|-----------|--------------------|--------------------------|-------------------------|------------------|--------------------------|
| WLAN 2.4G | 2462 | 10.4 | 10.96 | 0 | 0.18 |

When standalone SAR test exclusion applies to an antenna that transmits simultaneously with other antennas, the standalone SAR must be estimated according to following to determine simultaneous transmission SAR test exclusion:

[(max. power of channel, including tune-up tolerance, mW)/(min. test separation distance,mm)] · $[\sqrt{f(GHz)/x}]$ W/kg, for test separation distances \leq 50 mm; where x = 7.5 for 1-g SAR and x = 18.75 for 10-g SAR. When the minimum test separation distance is \leq 5 mm, a distance of 5 mm is applied to determine SAR

test Exclusion.

8. SAR MEASUREMENT RESULTS

This page summarizes the results of the performed dosimetric evaluation.

8.1 SAR Test Data

Environmental Conditions

| Temperature: | 22.4-23.1℃ | 21.9 - 22.7 ℃ |

| (*) | 848.8 | GPRS | / | / | / | / | / | / | |

Note:

1. When the SAR value is less than half of the limit, testing for other channels are optional.

2. The EUT transmit and receive through the same GSM antenna while testing SAR.

3. When SAR or MPE is not measured at the maximum power level allowed for production units, the results must be scaled to the maximum tune-up tolerance limit according to the power applied to the individual channels tested to determine compliance.

4. When the maximum output power variation across the required test channels is > 0.5 dB, instead of the middle channel, the highest output power channel must be used.

5. The Multi-slot Classes of EUT is Class 12 which has maximum 4 Downlink slots and 4 Uplink slots, the maximum active slots is 5, when perform the multiple slots scan, 3DL+2UL is the worst case.

| (******) | 846.6 | RMC | / | / | / | / | / | / | | |

Note:

1. When the SAR value is less than half of the limit, testing for other channels are optional.

2. The EUT transmit and receive through the same antenna while testing SAR.

3. The default test configuration is to measure SAR with an established radio link between the EUT and a communication test set using a 12.2 kbps RMC (reference measurement Channel) Configured in Test Loop Model.

4. KDB 941225 D01-Body SAR is not required for HSDPA/HSUPA/HSPA+ when the maximum average output of each RF channel is less than $\frac{1}{4}$ dB higher than measured 12.2kbps RMC or the maximum SAR for 12.2kbps RMC is < 75% of SAR limit.

5. When SAR or MPE is not measured at the maximum power level allowed for production units, the results must be scaled to the maximum tune-up tolerance limit according to the power applied to the individual channels tested to determine compliance.

| | 707.5 | 10 | 50%RB | 23.26 | 24.4 | 1.3 | 0.449 | 0.58 | / | | |

Note:

1. When the SAR value is less than half of the limit, testing for other channels are optional.

2. SAR for LTE band exposure configurations is measured according to the procedures of KDB 941225 D05 SAR for LTE Devices v02.

3. KDB941225D05-SAR for higher order modulation is required only when the highest maximum output power for the configuration in the higher order modulation is > 0.5 dB higher than the same configuration in QPSK or when the reported SAR for the QPSK configuration is > 1.45 W/kg

4. KDB941225D05-For QPSK with 100% RB allocation, when the reported SAR measured for the Highest output power channel is <1.45 W/kg, tests for the remaining required test channels are optional.

5.KDB941225D05- For QPSK with 100% RB allocation, SAR is not required when the highest maximum output power for 100 % RB allocation is less than the highest maximum output power in 50% and 1 RB allocations and the highest reported SAR for 1 RB and 50% RB allocation are ≤ 0.8 W/kg.

6. KDB941225D05- Start with the largest channel bandwidth and measure SAR for QPSK with 1 RB allocation, using the RB offset and required test channel combination with the highest maximum output power among RB offset the upper edge, middle and lower edge of each required test channel.

7. KDB941225D05- other channel bandwidths SAR test is required when the highest maximum output power of a configuration requiring testing in the smaller channel bandwidth is > 0.5 dB higher than the equivalent channel configurations in the largest channel bandwidth configuration or the reported SAR of a configuration for the largest channel bandwidth is > 1.45 W/kg.

9. Measurement Variability

In accordance with published RF Exposure KDB procedure 865664 D01 SAR measurement 100 MHz to 6 GHz v01. These additional measurements are repeated after the completion of all measurements requiring the same head or body tissue-equivalent medium in a frequency band. The test device should be returned to ambient conditions (normal room temperature) with the battery fully charged before it is re-mounted on the device holder for the repeated measurement(s) to minimize any unexpected variations in the repeated results

- 1) Repeated measurement is not required when the original highest measured SAR is < 0.80 W/kg; steps 2) through 4) do not apply.
- 2) When the original highest measured SAR is ≥ 0.80 W/kg, repeat that measurement once.
- Perform a second repeated measurement only if the ratio of largest to smallest SAR for the original and first repeated measurements is > 1.20 or when the original or repeated measurement is ≥ 1.45 W/kg (~ 10% from the 1-g SAR limit).
- 4) Perform a third repeated measurement only if the original, first or second repeated measurement is ≥1.5 W/kg and the ratio of largest to smallest SAR for the original, first and second repeated measurements is > 1.20.

Note: The same procedures should be adapted for measurements according to extremity and occupational exposure limits by applying a factor of 2.5 for extremity exposure and a factor of 5 for occupational exposure to the corresponding SAR thresholds.

The Highest Measured SAR Configuration in Each Frequency Band

Head (Face Up)

| SAR probe | Frequency | | EUT Position | Meas. SA | R (W/kg) | Largest | |
|-------------------|------------|------------|--------------|----------|----------|------------------------|--|
| calibration point | Band | Freq.(MHz) | | Original | Repeated | toSmallestSAR Ratio | |
| 1750 MHz | LTE Band 4 | 1732.5 | Face Up | 1.11 | 1.06 | 1.05 | |

Note:

1. Second Repeated Measurement is not required since the ratio of the largest to smallest SAR for the original and first repeated measurement is not > 1.20.

2. The measured SAR results **do not** have to be scaled to the maximum tune-up tolerance to determine if repeated measurements are required.

3. SAR measurement variability must be assessed for each frequency band, which is determined by the SAR probe calibration point and tissue-equivalent medium used for the device measurements.

10. DUT HOLDER PERTURBATIONS

In accordance with TCB workshop October 2016:

1) SAR perturbation due to test device holders, depending on antenna locations, buttons locations on phones or device, form factor (e.g. dongles etc.), the measured SAR could be influenced by the relative positions of the test device and its holder

2) SAR measurement standards have included protocols to evaluate this with a flat phantom, with and without the device holder

3) When the highest reported SAR of an antenna is > 1.2 W/kg, holderperturbation verification is required for each antenna, using the highest SAR configuration among all applicable frequency bandsin the same exact device and holder positions used for head and body SAR measurements; i.e. same device/button locations in the holder

PerIEEE 1528: 2013/Annex E/E.4.1.1:Device holder perturbation tolerance for a specific test device: Type B

When it is unknown if a device holder perturbs the fields of a test device, the SAR uncertainty shall be

assessed with a flat phantom (see Clause 5) by comparing the SAR with and without the device holder according to the following tests:

The SAR tolerance for device holder disturbance is computed using Equation (E.21) and entered in the

corresponding row of the appropriate uncertainty table with an assumed rectangular probability distribution $vi = \infty$ degrees of freedom:

$$SAR_{\text{tolerance}}[\%] = 100 \times \left(\frac{SAR_{\text{w/holder}} - SAR_{\text{w/o holder}}}{SAR_{\text{w/o holder}}}\right)$$
(E.21)

The Highest Measured SAR Configuration among allapplicable Frequency Band

| Energy on av Dond | Free (MIII) | EUT Desition | Meas. S | SAR (W/kg) | The Device holder | |
|-------------------|-------------|--------------|-------------|----------------|-----------------------------|--|
| Frequency Band | Freq.(MHz) | EUT Position | With holder | Without holder | perturbationuncerta inty | |
| / | / | / | / | / | / | |

11. SAR SIMULTANEOUS TRANSMISSION DESCRIPTION

Simultaneous Transmission:

| Description of Simultaneous Transmit Capabilities | | | | | | |
|---|---------------|----------|--|--|--|--|
| Transmitter Combination | Simultaneous? | Hotspot? | | | | |
| WWAN(GSM/WCDMA/LTE) + WLAN | \checkmark | × | | | | |

Simultaneous SAR test exclusion considerations:

Face Up Mode:

| Mode(SAR1+SAR2) | Position Reported 3 | | SAR(W/kg) | ΣSAR < |
|----------------------------|---------------------|------|-----------|---------|
| | | SAR1 | SAR2 | 1.6W/kg |
| WWAN(GSM/WCDMA/LTE) + WLAN | Face Up | 1.19 | 0.23 | 1.42 |

Conclusion:

Sum of SAR: Σ SAR ≤ 1.6 W/kg therefore simultaneous transmission SAR with Volume Scans is not required.

Limb Worn Mode:

| Mode(SAR1+SAR2) | Position | | | $\Sigma SAR <$ | |
|----------------------------|-----------|------|------|----------------|--|
| | | SAR1 | SAR2 | 4.0W/kg | |
| WWAN(GSM/WCDMA/LTE) + WLAN | Limb Worn | 2.68 | 0.18 | 2.86 | |

Conclusion:

Sum of SAR: Σ SAR \leq 4.0 W/kg therefore simultaneous transmission SAR with Volume Scans is not required.
