

W11 GPRS with WLAN PC Card

Function Exclusive Declaration

W11 successfully integrates a WLAN module and a GSM/GPRS module, named M32 into one PC Card. With Special Software automatically controls, customers could use either WLAN or GSM/ GPRS at a time. Users could active one RF module function and the other will be turned down automatically by W11 software. Users have no access to active both RF function from the User Interface. By this method, W11 cannot operate GPRS and WLAN at the same time.
