2.4 Description of Test mode

The EUT had been tested under operating condition.
 There are three channels have been tested as following:

| Band | Channel | Frequency |
|--------------|----------------|------------------|
| GSM850 | 128 | 824.2MHz |
| | 190 | 836.6MHz |
| | 251 | 848.8MHz |
| WCDMA Band V | 4132 | 826.4MHz |
| | 4183 | 836.6MHz |
| | 4233 | 846.6MHz |

The field strength of spurious emissions was measured at each position of all three axis X, Y and Z to compare the level, and the maximum noise.

The worst emission was found in Z (GSM850) and Y (WCDMA Band V) axis and the worst case recorded.

5. Effective Radiated Power

5.1 Measurement procedure

[FCC 22.913(a)]

<Step 1>

The EUT and support equipment are placed on a 1 meter x 1 meter surface, 0.8 meter height styrene foam table. Radiated emission measurements are performed at 3 meter distance with the broadband antenna (double ridged guide antenna). The antenna is positioned both the horizontal and vertical planes of polarization and height is varied 1 to 4 meters and stopped at height producing the maximum emission.

The turntable is rotated by 360 degrees and stopped at azimuth of producing the maximum emission.

<Step 2>

The substitution antenna is replaced by the transmitter antenna (EUT).

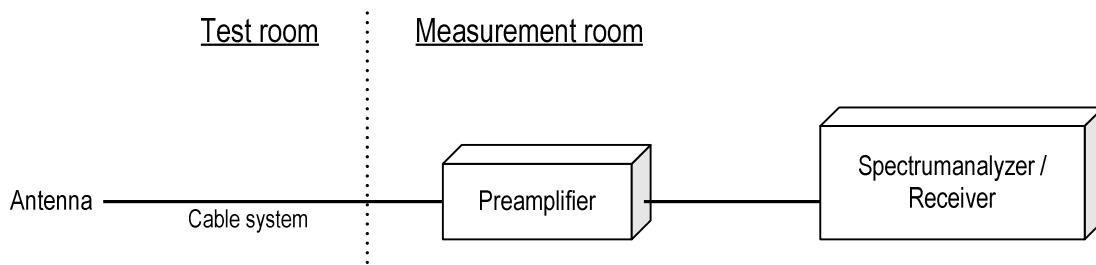

The frequency of the signal generator is adjusted to the measurement frequency.

Level of the signal generator is adjusted to the level that is obtained from step 1, and record the emission level of signal generator.

The spectrum analyzer is set to;

- a) Span = 1.5 times the OBW
- b) RBW = 1-5% of the expected OBW, not to exceed 1MHz
- c) VBW \geq 3 x RBW
- d) Number of sweep points \geq 2 x span / RBW
- e) Sweep time = auto-couple
- f) Detector = RMS (power averaging)
- g) If the EUT can be configured to transmit continuously (i.e., burst duty cycle \geq 98%), then set the trigger to free run.
- h) If the EUT cannot be configured to transmit continuously (i.e., burst duty cycle < 98 %), then use a sweep trigger with the level set to enable triggering only on full power bursts and configure the EUT to transmit at full power for the entire duration of each sweep. Ensure that the sweep time is less than or equal to the transmission burst duration.
- i) Trace average at least 100 traces in power averaging (i.e., RMS) mode.
- j) Compute the power by integrating the spectrum across the OBW of the signal using the instrument's band power measurement function, with the band limits set equal to the OBW band edges. If the instrument does not have a band power function, then sum the spectrum levels (in linear power units) at intervals equal to the RBW extending across the entire OBW of the spectrum.

5.2 Calculation method

Result (ERP) = S.G Reading – Cable loss + Antenna Gain

Margin = Limit - Result (ERP)

Example:

Limit @ 836.6MHz : 38.4dBm

S.G Reading = 33.3dBm Cable loss = 0.7dB Ant. Gain = -10.7dBd

Result = 33.3 - 0.7 + (-10.7) = 21.9dBm

Margin = 38.4 – 21.9= 16.5dB

5.3 Limit

Level of the signal generator is adjusted to the level that is obtained from step 1, and record the emission level of signal generator.

The spectrum analyzer is set to:

- a) RBW = 100kHz for below 1GHz and 1MHz for above 1GHz / VBW $\geq 3 \times$ RBW
- b) Detector = Peak
- c) Trace mode = Max hold
- d) Sweep time = auto-couple

9. Frequency Stability

9.1 Measurement procedure [FCC 22.355, 2.1055]

The EUT was placed of an inside of an constant temperature chamber as the temperature in the chamber was varied between -30°C and +50°C. The temperature was incremented by 10°C intervals and the unit was allowed to stabilize at each measurement. The frequency drift was measured with the normal Temperature and voltage tolerance and it is presented as the ppm unit.

Calculation:

Frequency Tolerance (ppm) = Measurements Frequency (Hz) – Reference Frequency (Hz) / Reference Frequency (Hz) x 1000000

10. Uncertainty of measurement

Expanded uncertainties stated are calculated with a coverage Factor k=2.

Please note that these results are not taken into account when determining compliance or non-compliance with test result.

| Test item | Measurement uncertainty |
|-------------------------------------|-------------------------|
| Conducted emission at mains port | ±3.0dB |
| Radiated emission (9kHz – 30MHz) | ±4.4dB |
| Radiated emission (30MHz – 1000MHz) | ±4.5dB |
| Radiated emission (1000MHz – 26GHz) | ±3.9dB |
