FCC ID: 2BB7B-ARSRUR

## **RF Exposure Evaluation**

According to KDB 447498 D01 V06 and part 2.1093, Unless specifically required by the *published RF exposure KDB procedures*, standalone 1-g head or body and 10-g extremity SAR evaluation for general population exposure conditions, by measurement or numerical simulation, is not required when the corresponding *SAR Test Exclusion Threshold* condition(s), listed below, is (are) satisfied.

For 100 MHz to 6 GHz and test separation distances ≤ 50 mm, the 1-g and 10-g SAR test exclusion thresholds are determined by the following:

[(max. power of channel, including tune-up tolerance, mW) / (min. test separation distance, mm)]  $\cdot [\sqrt{f_{(GHz)}}] \le 3.0$  for 1-g SAR, and  $\le 7.5$  for 10-g extremity SAR, where

f(GHz) is the RF channel transmit frequency in GHz

Power and distance are rounded to the nearest mW and mm before calculation

The result is rounded to one decimal place for comparison

EIRP=E<sub>Meas</sub>+20log(d<sub>Meas</sub>)-104.7

EIRP is the equivalent isotropically radiated power, in dBm

 $E_{Meas}$  is the field strength of the emission at the measurement distance, in dB  $\mu$  V/m

d<sub>Meas</sub> is the measurement distance, in m

# Here, For BT

Field strength	EIRP	Max tune-up	Frequency	Min.	Calc.	limit
(dBuV/m)	(dBm)	(mW)	(MHz)	distance(mm)	thresholds	
85.12	-10.04	0.10	2480	5	0.03	3.0

#### For wifi 2.4G

Max Power(dBm)	Max Power(mW)	Frequency(MHz)	Min. distance(mm)	Calc. thresholds	limit
4.811	3.03	2437	5	0.95	3.0

### For WIFI 5.1

Max Power(dBm)	Max Power(mW)	Frequency(MHz)	Min. distance(mm)	Calc. thresholds	limit
5.243	3.34	5240	5	1.53	3.0

#### For WIFI 5.8

Max Power(dBm)	Max Power(mW)	Frequency(MHz)	Min. distance(mm)	Calc. thresholds	limit
5.123	3.25	5825	5	1.57	3.0

BT and WIFI cannot transmit simultaneously, So a SAR test is not required
