

Table 4-7: All RX ATP Test Procedure

Step	Action
11	NOTE When testing diversity RX paths on companion frames, be sure to follow the RX test cable connection information in Table 4-1 or Table 4-2, as applicable, during this step. Follow cable connection directions as they are displayed, and click the Continue button to begin testing. – When the ATP process is completed, results will be displayed in the status report window.
12	Click the Save Results or Dismiss button. NOTE If Dismiss is used, the test results <i>will not</i> be saved in the test report file.

Individual Acceptance Tests

The following individual ATP tests can be used to evaluate specific aspects of BTS operation against individual performance requirements. All testing is performed using the LMF *GUI* environment.

TX Testing

TX tests verify any given transmit antenna path and output power control. All tests are performed using the external, calibrated test equipment. All measurements are made at the appropriate BTS **TX OUT** connector(s).

TX tests verify TX operation of the entire CDMA forward link using selected BBXs assigned to respective sector antennas. Each BBX is keyed up to generate a CDMA carrier (using both `bbxlevel` and `BLO`) at the CDF file-specified carrier output power level.

RX Testing

RX testing verifies receive antenna paths for BBXs selected for the test. All tests are performed using the external, calibrated test equipment to inject a CDMA RF carrier with all zero longcode at the specified RX frequency at the appropriate BTS **RX IN** connector(s).

RX tests verify RX operation of the entire CDMA reverse link using all equipped MCCs assigned to all respective sector/antennas.

Individual Tests

Spectral Purity TX Mask

This test verifies that the transmitted CDMA carrier waveform generated on each sector meets the transmit spectral mask specification (as defined in IS-97) with respect to the assigned CDF file values.

Waveform Quality (Rho)

This test verifies that the transmitted Pilot channel element digital waveform quality (ρ) exceeds the minimum specified value in IS-97. *Rho* represents the correlation between the actual and perfect CDMA modulation spectrums. 1.0000 represents 100% (or perfect correlation).

Pilot Time Offset

The Pilot Time Offset is the difference between the communications system test set measurement interval (based on the BTS system time reference) and the incoming block of transmitted data from the BTS (Pilot only, Walsh code 0).

Code Domain Power/Noise Floor

This test verifies the code domain power levels, which have been set for all ODD numbered Walsh channels, using the OCNS command. This is done by verifying that the ratio of PILOT divided by OCNS is equal to 10.2 ± 2 dB, and, that the noise floor of all EVEN numbered “OFF” Walsh channels measures ≤ -27 dB for IS-95A/B and CDMA2000 1X with respect to total CDMA channel power.

BTS FER

This test verifies the BTS receive FER on all traffic channel elements currently configured on all equipped MCCs (full rate at one percent FER) at an RF input level of –119 dBm on the *main* RX antenna paths using operator–selected, CDF–*equipped* MCCs and BBXs at the site. *Diversity* RX antenna paths are also tested using the lowest equipped MCC channel element ONLY.

NOTE

There are no pass/fail criteria associated with FER readings taken at levels below –119 dBm, other than to verify that the FER measurement reflects changes in the RX input signal level.

TX Spectral Purity Transmit Mask Acceptance Test

Background

Overview – This test verifies the spectral purity of each operator-selected BBX carrier keyed up at a specific frequency *specified in the current CDF*. All tests are performed using the external, calibrated test equipment controlled by the same command. All measurements are made at the appropriate BTS TX antenna connector.

Test Patterns – There are four operator-selectable test patterns with which this acceptance test can be performed. The patterns, along with the channels tested and gain setting for each, are listed in Table 3-34. Refer to “TX Calibration and the LMF” in the Bay Level Offset Calibration section of Chapter 3 for more information on the test patterns.

Equipment Operation During Testing – At least one MCC must be selected to perform the Standard, CDF Pilot, and CDF test patterns. For these test patterns, forward links will be enabled for synch channel (SCH), paging channel (PCH), and traffic channel (TCH) elements from the selected MCC(s), as shown in Table 3-34. Gain will be set for the applicable channels on each antenna as shown in the table. The operator-selected BBXs will be keyed using a BLO-corrected `bbxlv1` value to generate a CDMA carrier. RF output power, as measured at the appropriate frame TX antenna connector, will be set to one of the following depending on the operating frequency spectrum:

- 800 MHz: 33.5 dBm
- 1.9 GHz: 31.0 dBm

Test Measurements – The test equipment will measure and return the attenuation level in dB of all spurious and IM products with respect to the mean power of the CDMA channel measured in a 1.23 MHz bandwidth, verifying that results meet system tolerances at the following test points (see also Figure 4-2):

- For 800 MHz:
 - At least **–45 dB @ + 750 kHz** from center frequency
 - At least **–45 dB @ – 750 kHz** from center frequency
 - At least **–60 dB @ – 1980 kHz** from center frequency
 - At least **–60 dB @ + 1980 kHz** from center frequency
- For 1.9 GHz:
 - At least **–45 dB @ + 885 kHz** from center frequency
 - At least **–45 dB @ – 885 kHz** from center frequency
 - At least **–55 dB @ – 1980 kHz** from center frequency
 - At least **–55 dB @ + 1980 kHz** from center frequency

Redundant BBX Testing – The BBX will then de-key, and if selected, the redundant BBX will be assigned to the current TX antenna path under test. The test will then be repeated.

Spectral Purity TX Mask Acceptance Test

Follow the steps in Table 4-8 to verify the transmit spectral mask specification on the TX antenna paths for the selected BBXs.

Table 4-8: Test Spectral Purity Transmit Mask

Step	Action
1	Set up the test equipment for TX acceptance tests per Table 4-3.
2	Select the BBXs to be tested.
3	If the Test Pattern to be used is Standard , CDFPilot , or CDF ; select at least one MCC (Refer to “Test Pattern Drop-down Pick List” on page 3-90.)
4	Click on Tests in the BTS menu bar, and select TX > TX Mask... from the pull-down menus.
5	Select the appropriate carrier(s) and sector(s) (carrier-bts#-sector#-carrier#) from those displayed in the Channels/Carrier pick list. NOTE To select multiple items, hold down the Shift or Ctrl key while clicking on pick list items to select multiple carrier(s)–sector(s).
6	Verify that the correct channel number for the selected carrier is shown in the Carrier # Channels box. If it is not, obtain the latest bts-#.cdf (or bts-#.necf) and cbsc-#.cdf files from the CBSC. NOTE If necessary, the correct channel number may be manually entered into the Carrier # Channels box.
7	If at least one MCC was selected in Step 3, select the appropriate transfer rate (1 = 9600, 3 = 9600 1X) from the drop-down list in the Rate Set box. NOTE The Rate Set selection of 3 is only available if 1X cards are selected for the test.
8	In the Test Pattern box, select the test pattern to use for the calibration from the drop-down list (refer to “Test Pattern Drop-down Pick List” under “TX Calibration and the LMF” in the Bay Level Offset Calibration section of Chapter 3).
9	Click OK to display a status bar followed by a Directions pop-up window.
10	Follow the cable connection directions as they are displayed, and click the Continue button to begin testing. – As the ATP process is completed, results will be displayed in a status report window.
11	Click the Save Results or Dismiss button. NOTE If Dismiss is used, the test results <i>will not</i> be saved in the test report file.

Figure 4-2: TX Mask Verification Spectrum Analyzer Display

TX Waveform Quality (Rho) Acceptance Test

Background

Overview – This test verifies the transmitted pilot channel element digital waveform quality of each operator–selected BBX carrier keyed up at a specific frequency *specified in the current CDF*. All tests are performed using the external, calibrated test equipment controlled by the same command. All measurements are made at the appropriate TX antenna connector.

Equipment Operation During Testing – Pilot gain will be set to 262 for each antenna, and all TCH elements from the MCCs will be forward–link disabled. The selected BBXs will be keyed up using both `bbx1v1` and `BLO` to generate a CDMA carrier (with pilot channel element only, Walsh code 0). RF output power is set at 40 dBm as measured at the appropriate BTS TX antenna connector.

Test Measurements – The test equipment will measure and return the pilot channel element digital waveform quality (rho) percentage, verifying that the result meets the following specification:

Waveform quality (Rho) should be > **0.912**.

Redundant BBX Testing – The BBX will then de–key, and if selected, the redundant BBX will be assigned to the current TX antenna path under test. The test will then be repeated for the redundant BBX.

Waveform Quality (Rho) Acceptance Test

Follow the steps in Table 4-9 to verify the pilot channel element waveform quality (rho) on the TX antenna paths for the selected BBXs.

Table 4-9: Test Waveform Quality (Rho)	
Step	Action
1	Set up the test equipment for TX acceptance tests per Table 4-3.
2	Select the BBXs to be tested.
3	Click on Tests in the BTS menu bar, and select TX > Rho... from the pull-down menus.
4	Select the appropriate carrier(s) and sector(s) (carrier-bts#-sector#-carrier#) from those displayed in the Channels/Carrier pick list. NOTE To select multiple items, hold down the Shift or Ctrl key while clicking on pick list items to select multiple carrier(s)–sector(s).
5	Verify that the correct channel number for the selected carrier is shown in the Carrier # Channels box. If it is not, obtain the latest bts-#.cdf (or bts-#.necf) and cbsc-#.cdf files from the CBSC. NOTE If necessary, the correct channel number may be manually entered into the Carrier # Channels box.
6	Click OK to display a status bar followed by a Directions pop-up window.
7	Follow the cable connection directions as they are displayed, and click the Continue button to begin testing. – As the ATP process is completed, results will be displayed in a status report window.
8	Click the Save Results or Dismiss button. NOTE If Dismiss is used, the test results <i>will not</i> be saved in the test report file.

TX Pilot Time Offset Acceptance Test

Background

Overview – This test verifies the transmitted pilot channel element Pilot Time Offset of each operator–selected BBX carrier keyed up at a specific frequency *specified in the current CDF*. All tests will be performed using the external, calibrated test equipment controlled by the same command. All measurements will be made at the BTS TX antenna connector.

Equipment Operation During Testing – The pilot gain will be set to 262 for each antenna and all TCH elements from the MCCs will be forward–link disabled. The selected BBXs will be keyed using both `bbx1v1` and BLO to generate a CDMA carrier (with pilot channel element only, Walsh code 0). TX power output is set at 40 dBm as measured at the TX output.

Test Measurements – The test equipment will measure and return the Pilot Time Offset in μs , verifying that results meet the following specification:

Pilot Time Offset should be within **3 μs** of the target PT Offset (zero μs).

Redundant BBX Testing – The BBX will then de–key, and if selected, the redundant BBX will be assigned to the current TX antenna path under test. The test will then be repeated for the redundant BBX.

NOTE

This test also executes and returns the TX Frequency and TX Waveform Quality (rho) ATP tests, however, only *Pilot Time Offset* results are written to the ATP test report.

Pilot Time Offset Acceptance Test

Follow the steps in Table 4-10 to verify the Pilot Time Offset on the TX antenna paths for the selected BBXs.

Table 4-10: Test Pilot Time Offset

Step	Action
1	Set up the test equipment for TX acceptance tests per Table 4-3.
2	Select the BBXs to be tested.
3	Click on Tests in the BTS menu bar, and select TX > Pilot Time Offset... from the pull-down menus.
4	Select the appropriate carrier(s) and sector(s) (carrier-bts#-sector#-carrier#) from those displayed in the Channels/Carrier pick list. NOTE To select multiple items, hold down the Shift or Ctrl key while clicking on pick list items to select multiple carrier(s)–sector(s).
5	Verify that the correct channel number for the selected carrier is shown in the Carrier # Channels box. If it is not, obtain the latest bts-#.cdf (or bts-#.necf) and cbsc-#.cdf files from the CBSC. NOTE If necessary, the correct channel number may be manually entered into the Carrier # Channels box.
6	Click OK to display a status bar followed by a Directions pop-up window.
7	Follow the cable connection directions as they are displayed, and click the Continue button to begin testing. – As the ATP process is completed, results will be displayed in a status report window.
8	Click the Save Results or Dismiss button. NOTE If Dismiss is used, the test results <i>will not</i> be saved in the test report file.

TX Code Domain Power/Noise Floor Acceptance Test

Background

Overview – This test verifies the Code Domain Power and Noise Floor of each operator–selected BBX carrier keyed at a specific frequency *specified in the current CDF*. All tests are performed using the external, calibrated test equipment controlled by the same command. All measurements are made at the appropriate BTS TX antenna connector.

CDMA Channel Test Set–up – Pilot gain will be set to 262 for each antenna and the selected MCCs will be configured to supply all odd–numbered Walsh code traffic channel elements by enabling Orthogonal Channel Noise Source (OCNS) on all odd MCC channel elements (maximum 32 full rate channels with an OCNS gain of 81). All even–numbered Walsh code traffic channel elements will not have OCNS enabled, and are considered “OFF”. Selected MCCs will be forward–link enabled for the antenna (sector) under test.

Equipment Operation During Testing – The BBX will be keyed up using a BLO–corrected `bbxlv1` value to generate a CDMA carrier consisting of pilot and OCNS channels. RF output power, as measured at the appropriate frame TX antenna connector, is set at one of the following values depending on the operating frequency spectrum:

- 800 MHz: 33.5 dBm
- 1.9 GHz: 31.0 dBm

Test Measurements – The test equipment will measure and return the channel element power in dB of all specified Walsh channels within the CDMA spectrum. Additional calculations will be performed to verify the following parameters are met (refer to Figure 4-3 for graphic representations):

- Traffic channel element power level will be verified by calculating the ratio of Pilot power to OCNS gain of all traffic channels (root sum of the square (RSS) of each OCNS gain divided by the Pilot power). This value should be **10.2 dB ± 2.0 dB**.
- Noise floor (unassigned “OFF” even–numbered Walsh channels) is verified to be **≤ –27 dB** for IS–95A/B and CDMA2000 1X with respect to total CDMA channel power.

NOTE

When performing this test using the LMF and the MCC is an MCC8E or MCC24E, the redundant BBX may fail or show marginal performance. This is due to a timing mismatch that the LMF does not address. Performing this test from the CBSC will not have this timing problem.

Redundant BBX Testing – The BBX will then de–key, and if selected, the redundant BBX will be assigned to the current TX antenna path under test. The test will then be repeated for the redundant BBX. Upon completion of the test, OCNS channels will be disabled on the specified MCC channel elements.

Code Domain Power/Noise Floor Test

Follow the steps in Table 4-11 to verify the Code Domain Power/Noise floor of each selected BBX carrier keyed up at a specific frequency.

Table 4-11: Test Code Domain Power/Noise Floor

Step	Action
1	Set up the test equipment for TX acceptance tests per Table 4-3.
2	Select the BBXs and MCCs to be tested.
3	Click on Tests in the BTS menu bar, and select TX > Code Domain Power... from the pull-down menus.
4	Select the appropriate carrier(s) and sector(s) (carrier-bts#-sector#-carrier#) from those displayed in the Channels/Carrier pick list. NOTE To select multiple items, hold down the Shift or Ctrl key while clicking on pick list items to select multiple carrier(s)–sector(s).
5	Verify that the correct channel number for the selected carrier is shown in the Carrier # Channels box. If it is not, obtain the latest bts-#.cdf (or bts-#.necf) and cbsc-#.cdf files from the CBSC. NOTE If necessary, the correct channel number may be manually entered into the Carrier # Channels box.
6	If at least one MCC was selected in Step 3, select the appropriate transfer rate (1 = 9600, 3 = 9600 1X) from the drop-down list in the Rate Set box. NOTE The Rate Set selection of 3 is only available if 1X cards are selected for the test.
7	Click OK to display a status bar followed by a Directions pop-up window.
8	Follow the cable connection directions as they are displayed, and click the Continue button to begin testing. – As the ATP process is completed, results will be displayed in a status report window.
9	Click the Save Results or Dismiss button. NOTE If Dismiss is used, the test results <i>will not</i> be saved in the test report file.

Figure 4-3: Code Domain Analyzer CD Power/Noise Floor Display Examples

RX FER Acceptance Test

Background

Overview – This test verifies the BTS Frame Erasure Rate (FER) on *all* TCHs currently configured on operator-selected MCCs (full rate at 1% FER) at –119 dBm. All tests are performed using the external, calibrated test equipment as the signal source controlled by the same command. Measurements are made at the specified BTS RX antenna connection.

Equipment Operation During Testing – The pilot gain on each MCC will be set to 262 for each TX antenna, and the forward link for all TCH elements from the MCCs will be enabled. Appropriate BBX(s) must be keyed in order to enable the RX receive circuitry. Operator-selected BBXs will be keyed using only `bbx1v1`, to generate a CDMA carrier with pilot channel element only. Transmit power output is set at –40 dBm. Test equipment output power is set so that the received power at the BBX is –119 dBm. The final output power setting of the test equipment takes into account the MPC type, BTS RF path losses, and test cable losses. If selected, the redundant BBX will be assigned to the current RX antenna paths under test.

Test Measurements – The LMF will prompt the MCC channel element under test to measure all-zero longcode and provide the FER report on the selected active MCC on the reverse link for the main and, if selected, diversity RX antenna paths. Results are evaluated to ensure they meet the following specification:

FER returned less than **1%** and Total Frames measured is **1500**

Redundant BBX Testing – After the test, the BBX and the test equipment will be de-keyed to shut down the pilot signal and the active channel element, respectively. If the redundant BBX was tested, BBXR assignment to an active sector will also be reset.

Antenna Connections for Companion Frame RX Diversity Tests – At a site equipped with companion frames, RX diversity for each SC4812ET Lite frame is provided by the receive antennas for the *collocated* companion frame. Because of this, performing FER on companion frame diversity RX requires different RX test cable connections than on a starter frame. When performing companion frame diversity RX FER, use Figure 4-1 and Table 4-1 or Table 4-2 to determine the correct location for the RX test cable connections.

FER Acceptance Test

Follow the steps in Table 4-12 to verify the FER on RX antenna paths using selected MCCs and BBXs.

Table 4-12: Test FER	
Step	Action
1	Set up the test equipment for RX acceptance tests per Table 4-3.
2	If a <i>companion</i> frame is being tested and either BOTH or DIV is to be selected in step NO TAG, perform the additional test equipment set-up in Table 4-4 for the <i>diversity</i> RX portion of the ATP. NOTE If the LMF has been logged into the BTS with a different Multi-Channel Preselector setting than the one to be used for this test, the LMF <i>must be logged out of the BTS and logged in again</i> with the new Multi-Channel Preselector setting. Using the wrong MPC setting can cause a false test failure.
3	Select the BBXs and MCCs to be tested.
4	Click on Tests in the BTS menu bar, and select RX > FER... from the pull-down menu.
5	Select the appropriate carrier(s) and sector(s) (carrier-bts#-sector#-carrier#) from those displayed in the Channels/Carrier pick list. NOTE To select multiple items, hold down the Shift or Ctrl key while clicking on pick list items to select multiple carrier(s)–sector(s).
6	Verify that the correct channel number for the selected carrier is shown in the Carrier # Channels box. If it is not, obtain the latest bts-#.cdf (or bts-#.necf) and cbsc-#.cdf files from the CBSC. NOTE If necessary, the correct channel number may be manually entered into the Carrier # Channels box.
7	Select the appropriate RX branch (Both, Main, or Diversity) in the drop-down list. NOTE If a companion frame with the inter-frame diversity RX cabling <i>disconnected</i> is being tested <i>do not select BOTH</i> in this step. The RX main and diversity paths must be tested separately for this configuration because each requires a different Multi-Coupler Preselector type to provide the proper test signal gain.
8	In the Rate Set box, select the appropriate data rate (1=9600, 2=14400, 3=9600 1X) from the drop-down list. NOTE The Rate Set selection of 2 is only available if non-1X cards are selected for the test. The Rate Set selection of 3 is only available if 1X cards are selected for the test.
9	Click OK to display a status bar followed by a Directions pop-up window.
10	NOTE When testing diversity RX paths on companion frames, be sure to follow the RX test cable connection information in Table 4-1 or Table 4-2, as applicable, during this step. Follow cable connection directions as they are displayed, and click the Continue button to begin testing. As the ATP process is completed, results will be displayed in the status report window.
11	Click the Save Results or Dismiss button. If Dismiss is used, the test results <i>will not</i> be saved in the test report file.

Generating an ATP Report

Background

Each time an ATP test is run, ATP data is updated and must be saved to an ATP report file using the **Save Results** button to close the status report window. The ATP report file *will not* be updated if the status reports window is closed using the **Dismiss** button.

ATP Report

A separate report is created for each BTS and includes the following for each test:

- Test name
- PASS or FAIL
- Description information (if applicable)
- BBX number
- Channel number
- Carrier number
- Sector number
- Upper test limit
- Lower test limit
- Test result
- Time stamp
- Details/Warning information (if applicable)

Follow the procedures in the Table 4-13 to view and create a printable file for the ATP report.

Table 4-13: Generating an ATP Report	
Step	Action
1	Click on the Login tab (if not in the forefront).
2	Click on the desired BTS in the Available Base Stations pick list to select it.
3	Click on the Report button.
4	If a printable file is not needed, click on the Dismiss button.
5	If a printable file is required, perform the following:
5a	– Select the desired file type (text, comma-delimited, HTML) for the report file from the drop-down list at the bottom of the screen.
5b	– Click the Save button to save the file. — The file will be saved in the selected format in the bts-# folder for the BTS selected.

Notes

Chapter 5

Leaving the Site

Updating Calibration Data Files

After completing the TX calibration and audit, updated CAL file information must be moved from the LMF *Windows* environment back to the CBSC, a Unix environment. The following procedures detail moving files from one environment to the other.

Copying CAL files from LMF to a Diskette

Follow the procedures in Table 5-1 to copy the CAL files from an LMF computer to a 3.5 diskette.

Table 5-1: Copying CAL Files to a Diskette	
Step	Action
1	With <i>Windows</i> running on the LMF computer, insert a disk into Drive A:\.
2	Launch the Windows Explorer application program from the Start > Programs menu list.
3	Select the applicable <x>:\<lmf home directory/cdma/bts-#> folder.
4	Drag the bts-#.cal file to Drive A.
5	Repeat Steps 3 and 4, as required, for other bts-# folders.

5

Copying CAL Files from Diskette to the CBSC

Follow the procedures in Table 5-2 to copy CAL files from a diskette to the CBSC.

Table 5-2: Copying CAL Files from Diskette to the CBSC	
Step	Action
1	Log into the CBSC on the OMC-R Unix workstation using your account name and password.
2	Place the diskette containing calibration file(s) in the workstation diskette drive.
3	Type in eject -q and press the Enter key.
4	Type in mount and press the Enter key. NOTE • Check to see that the message “<i>floppy/no_name</i>” is displayed on the last line. • If the eject command was previously entered, <i>floppy/no_name</i> will be appended with a number. Use the explicit <i>floppy/no_name</i> reference displayed.
5	Type in cd /floppy/no_name and press the Enter key.
6	Type in ls -lia and press the Enter key. – Verify the bts-#.cal file filename appears in the displayed directory listing.
7	Type in cd and press the Enter key.
8	Type in pwd and press the Enter key. – Verify the displayed response shows the correct home directory (/home/<user's name>).
9	With <i>Solaris versions of Unix</i> , create a Unix-formatted version of the bts-#.cal file in the home directory by performing the following:

... continued on next page

Table 5-2: Copying CAL Files from Diskette to the CBSC

Step	Action
9a	– Type the following command: dos2unix /floppy/no_name/bts-#.cal bts-#.cal Where: # = BTS number for which the CAL file was created
9b	– Press the Enter key. NOTE Other versions of Unix do not support the <code>dos2unix</code> command. In these cases, use the Unix cp (copy) command. The <i>copied</i> files will contain DOS line feed characters which must be edited out with a Unix text editor.
10	Type in ls -l *.cal and press the Enter key. Verify the CAL files have been copied. – Verify all CAL files to be transferred appear in the displayed listing.
11	Type in eject , and press the Enter key.
12	Remove the diskette from the workstation.

Prepare to Leave the Site

Removing External Test Equipment

Perform the procedure in Table 5-3 to disconnect the test equipment and configure the BTS for active service.

Table 5-3: Remove External Test Equipment	
Step	Action
1	⚠ WARNING Be sure no BBXs are keyed before performing this step. Failure to do so can result in personal injury and damage to BTS LPAs. Disconnect all external test equipment from all TX and RX connectors at the rear of the frame.
2	Reconnect and visually inspect all TX and RX antenna feed lines at the frame RF interface panel. NOTE Verify that all sector antenna feed lines are connected to the correct antenna connectors on the frame. Crossed antenna cables will degrade call processing.

Reset All Devices and Initialize Site Remotely

Generally, devices in the BTS should not be left with data and code loaded from the LMF. The configuration data and code loads used for normal operation could be different from those stored in the LMF files. By resetting all devices, the required data and code can be loaded from the CBSC using the DLM when spans are again active.

To reset all devices and have the OMCR/CBSC bring up the site remotely, perform the procedure in Table 5-4.

Table 5-4: Reset BTS Devices and Remote Site Initialization	
Step	Action
1	Terminate the LMF session by following the procedures in Table 5-6.
2	Cycle BTS power <i>off</i> , as specified in Table 2-9 and Table 2-10, and <i>on</i> , as specified in Table 2-11 and Table 2-12.
3	Reconnect spans by following the procedure in Table 5-7.
4	Notify the OMCR/CBSC to take control of the site and download code and data to the BTS.
5	Verify the CBSC can communicate with the GLIs.

Bringing Modules into Service with the LMF

NOTE	Whenever possible, have the CBSC/MM bring up the site and enable all devices at the BTS.
-------------	--

If there is a reason code and/or data should or could not be loaded remotely from the CBSC, follow the steps outlined in Table 5-5 as required to bring BTS processor modules from OOS to INS state.

Table 5-5: Bring Modules into Service

Step	Action
1	In the LMF <i>GUI</i> environment, select the device(s) to be enabled by clicking on each one. NOTE - The MGLI and CSM must be INS_ACT (bright green) before an MCC can be enabled. - Processors which must be enabled and the order of enabling are as follows: 1. MGLI 2. CSMs 3. MCCs
2	Click on Device in the BTS menu bar, and select Enable from the pull-down list. – A status report window is displayed. NOTE If a BBX is selected, a transceiver parameters window is displayed to collect keying information. <i>Do not enable the BBX.</i>
3	Click Cancel to close the transceiver parameters window, if applicable.
4	Click OK to close the status report window. – The color of devices which successfully change to INS will change bright green.

Terminating LMF Session/Removing Terminal

Perform the procedure in Table 5-6 as required to terminate the LMF *GUI* session and remove the LMF computer.

Table 5-6: Remove LMF

Step	Action
1	! CAUTION Do not power down the LMF terminal without performing the procedure below. Corrupted/lost data files may result. Log out of all BTS sessions and exit LMF by clicking on File in the LMF window menu bar and selecting Logout and Exit from the pull-down list.
2	In the <i>Windows</i> Task Bar, click Start and select Shutdown .
3	Click Yes when the Shut Down Windows message appears
4	Wait for the system to shut down and the screen to go blank.

... continued on next page

Table 5-6: Remove LMF

Step	Action
5	Disconnect the LMF terminal Ethernet port from the BTS frame.
6	Disconnect the LMF terminal serial port, the RS-232-to-GPIB interface box, and the GPIB cables as required for equipment transport.

Connecting BTS T1/E1 Spans

Before leaving the site, connect any T1 or E1 span connectors removed previously to allow the LMF to control the BTS. Refer to Table 5-7 and Figure 3-2.

Table 5-7: Connect T1 or E1 Spans

Step	Action
1	Re-connect any disconnected span connectors to the Span I/O A and B boards.
2	If equipped, ensure the CSU is powered on.
3	Verify span status, ensuring the OMC-R/CBSC can communicate with the BTS.

Before Leaving the site

Be sure all requirements listed in Table 5-8 are completed before leaving the site.

Table 5-8: Check Before Leaving the Site

Step	Action
1	When backup batteries are installed, <i>all</i> battery circuit breakers are ON (pushed in).
2	<i>Both</i> heat exchanger circuit breakers on the DC PDA are set to ON (pushed in), and the heat exchanger blowers are running.
3	The External Blower Assembly (EBA) power cable is connected, and the EBA is running.
4	The MAP power switch is set to ON , and the POWER (green) LED is lighted.
5	The MAP TCP switch is set to ON .
6	The BATT TEST switch on the MAP is set to OFF , and the BATT. TEST (amber) LED is <i>not lighted</i> .
7	No alarm conditions are being reported to the CBSC with all frame doors closed.

Chapter 6

Basic Troubleshooting

Basic Troubleshooting: Overview

Overview

The information in this chapter addresses some of the scenarios likely to be encountered by Customer Field Engineering (CFE) team members while performing BTS optimization and acceptance testing. This troubleshooting guide was created as an interim reference document for use in the field. It provides “what to do if” basic troubleshooting suggestions when the BTS equipment does not perform according to the procedures documented in the manual.

Comments are consolidated from inputs provided by CFEs and information gained from experience in Motorola labs and classrooms.

Troubleshooting: Installation

Cannot Log into Cell-Site

Table 6-1: Login Failure Troubleshooting Procedures		
✓	Step	Action
	1	If the MGLI LED is solid RED, it implies a hardware failure. Reset MGLI by re-seating it. If this persists, install GLI card in MGLI slot and retry. A Red LED may also indicate no termination on an external LAN connector (power entry compartment at rear of frame).
	2	Verify that the span line is disconnected at the Span I/O card. If the span is still connected, verify the CBSC has disabled the BTS.
	3	Try to 'ping' the MGLI.
	4	Verify the LMF is connected to the <i>primary</i> LAN (LAN A) at the LAN shelf below the SCCP cage. If LAN A is not the active LAN, force a LAN switch to LAN A by following the procedure in Table 6-2.
	5	Verify the LMF was configured properly.
	6	If a Xircom parallel BNC LAN interface is being used, verify the BTS-LMF cable is RG-58 (flexible black cable less than 2.5 feet in length).
	7	Verify the external LAN connectors are properly terminated (power entry compartment at rear of frame).
	8	Verify a T-adapter is <i>not</i> used on LMF computer side connector when connected to the primary LAN at the LAN shelf.
	9	Try connecting to the Ethernet Out port in the power entry compartment (rear of frame). Use a TRB-to-BNC (triax-to-coax) adapter at the LAN connector for this connection.
	10	Re-boot the LMF and retry.
	11	Re-seat the MGLI and retry.
	12	Verify GLI IP addresses are configured properly by following the procedure in Table 6-3.

Table 6-2: Force Ethernet LAN A to Active State as Primary LAN		
✓	Step	Action
	1	If LAN A is not the active LAN, make certain all external LAN connectors are either terminated with 50Ω loads or cabled to another frame.
	2	<i>If it has not already been done</i> , connect the LMF computer to the stand-alone or starter frame, as applicable (Table 3-5).
	3	<i>If it has not already been done</i> , start a GUI LMF session and log into the BTS on the active LAN (Table 3-6).
	4	Remove the 50Ω termination from the LAN B IN connector in the power entry compartment at the rear of the stand-alone or starter frame. The LMF session will become inactive.
	5	Disconnect the LMF computer from the LAN shelf LAN B connector and connect it to the LAN A connector.

... continued on next page

Table 6-2: Force Ethernet LAN A to Active State as Primary LAN

✓	Step	Action
	6	If the LAN was successfully forced to an active state (the cards in any cage can be selected and statused), proceed to step 13.
	7	With the 50Ω termination still removed from the LAN B IN connector, remove the 50Ω termination from LAN B OUT connector. If more than one frame is connected to the LAN, remove the termination from the last frame in the chain.
	8	If the LAN was successfully forced to an active state (the cards in any cage can be selected and statused), proceed to step 13.
	9	With the 50Ω terminations still removed from LAN B, unseat each GLI card in each frame connected to the LAN, until all are disconnected from the shelf backplanes.
	10	Reseat each GLI card until all are reconnected.
	11	Allow the GLIs to power up, and attempt to select and status cards in the CCP shelves. If LAN A is active, proceed to step 13.
	12	If LAN A is still not active, troubleshoot or continue troubleshooting following the procedures in Table 6-1.
	13	Replace the 50Ω terminations removed from the LAN B IN and OUT connectors.

Table 6-3: GLI IP Address Setting

✓	Step	Action
	1	If it has not previously been done, establish an MMI communication session with the GLI card as described in Table 3-10.
	2	Enter the following command to display the IP address and subnet mask settings for the card: config lg0 current A response similar to the following will be displayed: <pre>GLI2>config lg0 current lg0: IP address is set to DEFAULT (configured based on card location) lg0: netmask is set to DEFAULT (255.255.255.128)</pre>

. . . continued on next page

Table 6-3: GLI IP Address Setting

✓	Step	Action
	3	If the IP address setting response shows an IP address rather than “Default (configured based on card location),” enter the following: config lg0 ip default A response similar to the following will be displayed: <pre>GLI2>config lg0 ip default _param_config_lg0_ip(): param_delete(): 0x00050001 lg0: ip address set to DEFAULT</pre>
	4	If the GLI subnet mask setting does not display as “DEFAULT (255.255.255.128),” set it to default by entering the following command: config lg0 netmask default A response similar to the following will be displayed: <pre>GLI2>config lg0 netmask default _param_config_lg0_netmask(): param_delete(): 0x00050001 lg0: netmask set to DEFAULT</pre>
	5	Set the GLI route default to default by entering the following command: config route default default A response similar to the following will be displayed: <pre>GLI2>config route default default _esh_config_route_default(): param_delete(): 0x00050001 route: default gateway set to DEFAULT</pre>
	6	NOTE Changes to the settings will not take effect unless the GLI is reset. When changes are completed, close the MMI session, and reset the GLI card.

... continued on next page

Table 6-3: GLI IP Address Setting

✓	Step	Action
	7	Once the GLI is reset, re-establish MMI communication with it and issue the following command to confirm its IP address and subnet mask settings: config lg0 current A response similar to the following will be displayed: <pre>GLI2>config lg0 current lg0: IP address is set to DEFAULT (configured based on card location) lg0: netmask is set to DEFAULT (255.255.255.128)</pre>
	8	Repeat steps 1 through 7 for all remaining GLIs, including those in any additional, inter-connected frames.

Cannot Communicate with Power Meter

Table 6-4: Troubleshooting a Power Meter Communication Failure

✓	Step	Action
	1	Verify power meter is connected to LMF with GPIB adapter.
	2	Verify cable connections as specified in Chapter 3.
	3	Verify the GPIB address of the power meter is set to the same value displayed in the applicable GPIB address box of the LMF Options window Test Equipment tab. Refer to Table 3-23 or Table 3-24 and the Setting GPIB Addresses section of Appendix NO TAG for details.
	4	Verify the GPIB adapter DIP switch settings are correct. Refer to Test Equipment Preparation section of Appendix NO TAG for details.
	5	Verify the GPIB adapter is not locked up. Under normal conditions, only 2 green LEDs must be 'ON' (Power and Ready). If any other LED is continuously 'ON', then cycle GPIB box power and retry.
	6	Verify the LMF computer COM1 port is not used by another application; for example, if a HyperTerminal window is open for MMI, close it.
	7	Reset <i>all</i> test equipment by clicking Util in the BTS menu bar and selecting Test Equipment > Reset from the pull-down lists.

Cannot Communicate with Communications System Analyzer

Table 6-5: Troubleshooting a Communications System Analyzer Communication Failure

✓	Step	Action
	1	Verify analyzer is connected to LMF with GPIB adapter.
	2	Verify cable connections as specified in Chapter 3.
	3	Verify the analyzer GPIB address is set to the same value displayed in the applicable GPIB address box of the LMF Options window Test Equipment tab. Refer to Table 3-23 or Table 3-24 and the Setting GPIB Addresses section of Appendix F for details.
	4	Verify the GPIB adapter DIP switch settings are correct. Refer to Test Equipment Preparation section of Appendix NO TAG for details.
	5	Verify the GPIB adapter is not locked up. Under normal conditions, only 2 green LEDs must be 'ON' (Power and Ready). If any other LED is continuously 'ON', then cycle GPIB box power and retry.
	6	Verify the LMF computer COM1 port is not used by another application; for example, if a HyperTerminal window is open for MMI, close it.
	7	Reset <i>all</i> test equipment by clicking Util in the BTS menu bar and selecting Test Equipment > Reset from the pull-down lists.

Cannot Communicate with Signal Generator

Table 6-6: Troubleshooting a Signal Generator Communication Failure

✓	Step	Action
	1	Verify signal generator is connected to LMF with GPIB adapter.
	2	Verify cable connections as specified in Chapter 3.
	3	Verify the signal generator GPIB address is set to the same value displayed in the applicable GPIB address box of the LMF Options window Test Equipment tab. Refer to Table 3-23 or Table 3-24 and the Setting GPIB Addresses section of Appendix NO TAG for details.
	4	Verify the GPIB adapter DIP switch settings are correct. Refer to Test Equipment Preparation section of Appendix NO TAG for details.
	5	Verify the GPIB adapter is not locked up. Under normal conditions, only 2 green LEDs must be 'ON' (Power and Ready). If any other LED is continuously 'ON', then cycle GPIB box power and retry.
	6	Verify the LMF computer COM1 port is not used by another application; for example, if a HyperTerminal window is open for MMI, close it.
	7	Reset <i>all</i> test equipment by clicking Util in the BTS menu bar and selecting Test Equipment > Reset from the pull-down lists.

Troubleshooting: Download

Table 6-7: Troubleshooting Code Download Failure

✓	Step	Action
	1	Verify T1 or E1 span is disconnected from the BTS at Site I/O boards (Figure 3-2).
	2	Verify LMF can communicate with the BTS devices using the LMF Status function.
	3	Communication with MGLI must first be established before trying to communicate with any other BTS device. MGLI must be INS_ACT state (bright green).
	4	Verify the target card is physically present in the cage and powered-up.
	5	If the target card LED is solid RED, it implies hardware failure. Reset card by re-seating it. If LED alarm persists, replace with <i>same type of</i> card from another slot and retry.
	6	Re-seat card and try again.
	7	If a BBX reports a failure message and is OOS_RAM, the code load was OK. Use the LMF Status function to verify the load.
	8	If the download portion completes and the reset portion fails, reset the device by selecting the device and Reset .
	9	If a BBX or an MCC remains OOS_ROM (blue) after code download, use the LMF Device > Status function to verify that the code load was accepted.
	10	If the code load was accepted, use LMF Device > Download > Flash to load RAM code into flash memory.

Cannot Download DATA to Any Device (Card)

Table 6-8: Troubleshooting Data Download Failure

✓	Step	Action
	1	Re-seat card and repeat code and data load procedure.
	2	Verify the ROM and RAM code loads are of the same release by statusing the card. Refer to Download the BTS section of Chapter G for more information.

Cannot ENABLE Device

Before a device can be enabled (placed in service), it must be in the OOS_RAM state (yellow in LMF display) with data downloaded to the device. The color of the device on the LMF changes to green once it is enabled.

The four device states that can be displayed by the LMF are:

- Enabled (bright green, INS_ACT)
- Stand-by (olive green, INS_SBY – redundant CSM and GLI only)
- Disabled (yellow, OOS_RAM)
- Reset (blue, OOS_ROM)

Table 6-9: Troubleshooting Device Enable (INS) Failure

✓	Step	Action
	1	Re-seat card and repeat code and data load procedure.
	2	If CSM cannot be enabled, verify the CDF has correct latitude and longitude data for cell site location and GPS sync.
	3	Ensure primary CSM is in INS_ACT (bright green) state. NOTE MCCs will not enable without the CSM being INS.
	4	Verify 19.6608 MHz CSM clock is present; MCCs will not enable without it.
	5	BBXs should not be enabled for ATP tests.
	6	If MCCs give “invalid or no system time,” verify the CSM is enabled.
	7	Log out of the BTS, exit the LMF, restart the application, log into the BTS, and re-attempt device-enable actions.

LPA Errors

Table 6-10: LPA Errors

✓	Step	Action
	1	If LPAs give continuous alarms, cycle power with the applicable DC PDA circuit breakers.
	2	Establish an MMI session with the LPA (Table 3-10), connecting the cable to the applicable MMI port on the ETIB.
	2a	– Type alarms at the HyperTerminal window prompt and press Enter . — The resulting display may provide an indication of the problem.
	2b	– Call Field Support for further assistance.

Troubleshooting: Calibration

Bay Level Offset Calibration Failure

Table 6-11: Troubleshooting BLO Calibration Failure

✓	Step	Action
	1	Verify the power meter or communications system analyzer is configured correctly (see the Test Equipment Set-up section of Chapter 3), and is connected to the proper BTS TX antenna connector.
	2	If a power meter is being used:
	2a	– Re-calibrate the Power Meter and verify it is calibrated correctly with cal factors from the power sensor (refer to Appendix F).
	2b	– Verify the power sensor is functioning properly by checking it with the 1-mW (0 dBm) Power Ref signal.
	2c	– Verify communication between the LMF and Power Meter is working by checking that the meter display is showing RES :
	3	Verify the parameters in the bts-#.cdf file are set correctly for the BTS operating band as follows: For 1900 MHz: Bandclass=1; Freq_Band=16 For 800 MHz: Bandclass=0; Freq_Band=8
	4	Verify that no LPA on the carrier is in alarm state (rapidly flashing red LED).
	4a	– If any are, reset the LPA(s) by pulling the applicable circuit breaker on the DC PDA, and, after 5 seconds, pushing back in.
	5	Verify GPIB adapter is not locked up. Under normal conditions, only 2 green LEDs must be ‘ON’ (Power and Ready). If any other LED is continuously ‘ON’, power-cycle (turn power off and on) the GPIB Box and retry.

Calibration Audit Failure

Table 6-12: Troubleshooting Calibration Audit Failure

✓	Step	Action
	1	Verify the power meter or communications system analyzer is configured correctly (see the Test Equipment Set-up section of Chapter 3), and is connected to the proper BTS TX antenna connector.
	2	If a power meter is being used:
	2a	– Re-calibrate the Power Meter and verify it is calibrated correctly with cal factors from the power sensor (refer to Appendix F).
	2b	– Verify the power sensor is functioning properly by checking it with the 1-mW (0 dBm) Power Ref signal.
	2c	– Verify communication between the LMF and Power Meter is working by checking that the meter display is showing RES :
	3	Verify that no LPA on the carrier is in alarm state (rapidly flashing red LED).
	3a	– If any are, reset the LPA(s) by pulling the applicable circuit breaker on the DC PDA, and, after 5 seconds, pushing back in.
	4	After calibration, the BLO data must be re-loaded to the BBXs before auditing. Click on the BBX(s), and in the BTS menu bar select Device > Download > BLO . Re-try the audit.
	5	Verify GPIB adapter is not locked up. Under normal conditions, only 2 green LEDs must be 'ON' (Power and Ready). If any other LED is continuously 'ON', power-cycle (turn power off and on) the GPIB Box and retry.
	6	If calibration was being performed for the <i>redundant</i> BBX, be sure the Single-Sided BLO checkbox was <i>not</i> checked in the CDMA Test Parameters test set-up window.
	7	If additional items, such as directional couplers or combiners, have been installed in the TX path, be sure that <i>one</i> of the following has been done: • Verify BLO checkbox in the CDMA Test Parameters test set-up window is <i>unchecked</i>. • The additional path losses have been added into each applicable sector using the Util > Edit > TX Coupler Loss... function.

Basic Troubleshooting: RF Path Fault Isolation

Overview

The optimization (RF path characterization or calibration) and post-calibration (audit) procedures measure and limit-check the BTS reported transmit and receive levels of the path from each BBX to the back of the frame. When a fault is detected, it is specific to a receive or transmit path. The troubleshooting process in this section determines the most probable cause of the fault.

As the calibration and audit tests are performed, results are displayed in the LMF test status report window. When faults are encountered, the test procedure in progress continues running and displaying any further faults. If it appears that there are major faults, the test can be aborted.

The test results can be saved to a **bts-#.rpt** file in the `<x>:\lmf home directory\cdma\bts-#` folder. To do this, close the test status report window using the *Save Results* button.

NOTE	Closing the test status report window with the <i>Dismiss</i> button will delete the test results without saving them.
-------------	--

If a test is re-run or a new calibration, audit, or test is run and the results are saved, the previous test results in the **bts-#.rpt** file are overwritten. To prevent losing previous test results in the **bts-#.rpt** file, refer to the procedure in Table 4-13 before performing further testing with the LMF.

If there are major faults, recheck the test equipment attachments for errors. If none are found, close the test status report window using the **Save Results** button, and save the contents of the resulting **bts-#.rpt** file as described in Table 4-13. Also, note other specifics about the failure, and proceed with the fault isolation procedure.

If Every Test Fails

Check the calibration equipment for proper operation by manually setting the signal generator output attenuator to the lowest output power setting. Connect the output port to the spectrum analyzer RF input port. Set the signal generator output attenuator to -90 dBm, and switch on the RF output. Verify that the spectrum analyzer can receive the signal, indicate the correct signal strength (accounting for the cable insertion loss), and indicate the approximate frequency.

Verify BLO Checkbox

When performing a calibration with the **TX Calibration...** or **All Cal/Audit...** functions, the **Verify BLO** checkbox should normally be checked. When a calibration fails, determine if any items such as directional couplers or combiners have been added to the TX path. If additional items have been installed in the path, try re-running the calibration with **Verify BLO** unchecked. If calibration still does not pass, refer to the following paragraphs and use the TX output fault isolation flowchart to identify the most probable cause of the failure.

Single-Sided BLO Checkbox

When performing a calibration with the **TX Calibration...** or **All Cal/Audit...** functions, the **Single-Sided BLO** checkbox should *not* be checked when the *redundant* BBX is being calibrated. When a calibration fails with the redundant BBX selected, try re-running the calibration with the **Single-Sided BLO** checkbox *unchecked*. If the calibration still fails, refer to the following paragraphs and use the TX output fault isolation flowchart to identify the most probable cause of the failure.

If Faults Are Isolated

If the fault reports are isolated between successful path checks, the root cause of the faults most likely lies with one or more of the Field Replaceable Unit (FRU) modules. If more than one failure was reported, look for a common denominator in the data. For example, if any TX test fails on one sector only, the BBX assigned to that sector (Table 1-6) is a likely cause. Also, look at the severity of the failure. If the path loss is just marginally out of the relaxed specification limit during the post-calibration TX audit, suspect excessive cable loss. If limits are missed by a wide margin, suspect mis-wired cables or total device failure. Use the TX output fault isolation flowchart in Figure 6-1 to identify the strongest possible cause for a failed TX test.

Fault Isolation Flowchart

The flowchart covers the transmit path. Transmit paths usually fail the lower test limit, indicating excessive loss in some component in the BTS site or mis-wiring. A failure of an upper limit usually indicates a problem with the test setup or external equipment. Before replacing a suspected FRU, always repeat and verify the test results to rule out a transient condition. If a BBX fails an upper limit in the post-calibration audit procedure, re-calibrate and verify the out-of-tolerance condition for that BBX and/or sector before replacement.

Flowchart Prerequisites

Before entering the fault isolation sequence outlined in the flowchart, be sure the following have been completed:

- GLIs, MCCs, and BBXs have been downloaded with the correct ROM code, RAM code, and data (Table 3-12, Table 3-13, and Table 3-14).
- MGLI, CSMs, and MCCs are enabled (Table 3-13, Table 3-16, and Table 3-17, respectively)
- Be sure the LED on the correct CCD card is *solid green*.
- Be sure no alarms are being reported by opening an LMF alarm window as outlined in Table 3-47.

TX Power Output Fault Isolation Flowchart

Figure 6-1: TX Output Fault Isolation Flowchart

Troubleshooting: Transmit ATP

BTS Passed Reduced ATP Tests but Has Forward Link Problem in Normal Operation

Follow the procedure in Table 6-13 to troubleshoot a forward link problem during normal operation after passing a reduced ATP.

Table 6-13: Troubleshooting Forward Link Failure (BTS Passed Reduced ATP)		
✓	Step	Action
	1	Perform the following additional tests to troubleshoot a forward link problem:
	1a	– TX mask
	1b	– TX rho
	1c	– TX code domain

Cannot Perform TX Mask Measurement

Table 6-14: Troubleshooting TX Mask Measurement Failure		
✓	Step	Action
	1	Verify that TX audit passes for the BBX(s).
	2	If performing manual measurement, verify analyzer setup.
	3	Verify that no LPA in the sector is in alarm state (flashing red LED). Re-set the LPA by pulling the circuit breaker, and, after 5 seconds, pushing it back in.

Cannot Perform Rho or Pilot Time Offset Measurement

Table 6-15: Troubleshooting Rho and Pilot Time Offset Measurement Failure		
✓	Step	Action
	1	Verify presence of RF signal by switching to spectrum analyzer screen.
	2	Verify PN offsets displayed on the analyzer is the same as the PN offset in the CDF file.
	3	Re-load MGLI code and data and repeat the test.
	4	If performing manual measurement, verify analyzer setup.
	5	Verify that no LPA in the sector is in alarm state (flashing red LED). Reset the LPA by pulling the circuit breaker, and, after 5 seconds, pushing back in.
	6	If Rho value is unstable and varies considerably (e.g. .95,.92,.93), this may indicate that the GPS is still phasing (trying to reach and maintain 0 freq. error). Go to the freq. bar in the upper right corner of the Rho meter and select Hz. Press <Shift-avg> and enter 10, to obtain an average Rho value. This is an indication the GPS has not stabilized before going <i>INS</i> and may need to be re-initialized.

Cannot Perform Code Domain Power and Noise Floor Measurement

Table 6-16: Troubleshooting Code Domain Power and Noise Floor Measurement Failure

✓	Step	Action
	1	Verify presence of RF signal by switching to spectrum analyzer screen on the communications system analyzer.
	2	Verify PN offset displayed on analyzer is same as PN offset being used in the CDF file.
	3	Disable and re-enable MCC (one or more MCCs based on extent of failure).

Troubleshooting: Receive ATP

Multi-FER Test Failure

Table 6-17: Troubleshooting Multi-FER Failure		
✓	Step	Action
	1	Verify test equipment is configured correctly for a FER test.
	2	Verify test equipment is locked to 19.6608 and even second clocks. On the HP 8921 analyzer, the yellow LED (REF UNLOCK) must be OFF .
	3	Verify MCCs have been loaded with data and are INS_ACT.
	4	Disable and re-enable the MCC (1 or more based on extent of failure).
	5	Disable, re-load code and data, and re-enable MCC (one or more MCCs based on extent of failure).
	6	Verify antenna connections to frame are correct based on the LMF directions messages.
	7	For diversity RX FER failures in companion frame configurations, verify the following:
	7a	
	7b	

Troubleshooting: CSM Check-list

Problem Description

Many Clock Synchronization Manager (CSM) board problems may be resolved in the field before sending the boards to the factory for repair. This section describes known CSM problems identified in field returns, some of which are field-repairable. Check these problems before returning suspect CSM boards.

Intermittent 19.6608 MHz Reference Clock / GPS Receiver Operation

If having any problems with CSM board kit numbers, SGLN1145 or SGLN4132, check the suffix with the kit number. If the kit has version “AB,” then replace with version “BC” or higher, and return model AB to the repair center.

No GPS Reference Source

Correct Hardware

Check the CSM boards for proper hardware configuration for the type of GPS in use and the cage slot where they are installed.

RF-GPS (Local GPS) – CSM kit SGLN1145, which should be installed in Slot 1, has an on-board GPS receiver; while kit SGLN4132, in Slot 2, does not have a GPS receiver.

Remote GPS (RGPS) – Kit SGLN4132ED or later, which should be installed in *both* Slot 1 and Slot 2, does not have a GPS receiver.

Any incorrectly configured board *must* be returned to the repair center. *Do not attempt to change hardware configuration in the field.* Also, verify the GPS antenna is not damaged and is installed per recommended guidelines.

RGPS Expansion Cabling

20-pair Punchblock Connections – For companion frame installations with RGPS, verify the 20-pair punchblock RGPS distribution connections in the RGPS expansion *primary* frame are correctly punched down in accordance with NO TAG.

50-pair Punchblock Connections – For companion frame installations with RGPS, verify the 50-pair punchblock RGPS distribution connections in both the RGPS expansion *primary* and *secondary* frames are correctly punched down in accordance with NO TAG and NO TAG.

Checksum Failure

The CSM could have corrupted data in its firmware resulting in a non-executable code. The problem is usually caused by either electrical disturbance, or interruption of data during a download. Attempt another download with no interruptions in the data transfer. Return CSM board back to repair center if the attempt to reload fails.

GPS Bad RX Message Type

This is believed to be caused by a later version of CSM software (3.5 or higher) being downloaded, via LMF, followed by an earlier version of CSM software (3.4 or lower), being downloaded from the CBSC. Download again with CSM software code 3.5 or higher. Return CSM board back to repair center if attempt to reload fails.

CSM Reference Source Configuration Error

This is caused by incorrect reference (clock) source configuration performed in the field by software download. CSM kit SGLN1145 and SGLN4132 must have proper reference sources configured, as shown in Table 6-18, to function correctly.

Table 6-18: CSM Reference (Clock) Sources by GPS Type and Kit Number				
GPS Type	CSM Kit No.	Hardware Configuration	CSM Slot No.	Reference Source Configuration
RF GPS	SGLN1145	With GPS Receiver	1	Primary = Local GPS Backup = Either LFR or HSO
	SGLN4132	Without GPS Receiver	2	Primary = Mate GPS Backup = Either LFR or HSO
REMOTE GPS	SGLN4132ED or later	Without GPS Receiver	1	Primary = Remote GPS Backup = Either LFR or HSO
			2	Primary = Remote GPS Backup = Either LFR or HSO

Takes Too Long for CSM to Come INS

This may be caused by a delay in GPS acquisition. Check the accuracy flag status and/or current position. Refer to the CSM System Time/GPS and LFR/HSO Verification section of Chapter 3. At least *one* satellite should be visible and tracked for the “surveyed” mode, and *four* satellites should be visible and tracked for the “estimated” mode. Also, verify correct base site position data used in “surveyed” mode.

Troubleshooting: SCCP Backplane

Introduction

The SCCP backplane is a multi-layer printed circuit board that interconnects all the SCCP modules. The complexity of this board lends itself to possible improper diagnoses when problems occur.

Connector Functionality

The following connector overview describes the major types of backplane connectors along with the functionality of each. This will assist the CFE to:

- Determine which connector(s) is associated with a specific problem type.
- Isolate problems to a specific cable or connector.

Span Line Connector

The span line input is an 8 pin RJ-45 connector that provides a primary and secondary (if used) span line interface to each GLI in the SCCP shelf. The span line is used for MM/EMX switch control of the Master GLI and also all the BBX traffic.

Power Input (Return A and B connectors)

Provides 27 volt input for use by the power supply modules.

Power Supply Module Interface

Each power supply module has a series of three different connectors to provide the needed inputs/outputs to the SCCP backplane. These include a VCC/Ground input connector, a Harting-style multiple pin interface, and a +15V/Analog Ground output connector. The Transceiver Power Module converts 27/48 Volts to a regulated +15, +6.5, +5.0 volts to be used by the SCCP shelf cards.

GLI Connector

This connector consists of a Harting 4SU digital connector and a 6-conductor coaxial connector for RDM distribution. The connectors provide inputs/outputs for the GLIs in the SCCP backplane.

GLI Ethernet “A” and “B” Connections

These SMB connectors are located on the SCCP backplane and connect to the GLI board. This interface provides all the control and data communications over the Ethernet LAN between the master GLI, the redundant GLI, and the LMF.

BBX Connector

Each BBX connector consists of a Harting 2SU/1SU digital connector and two 6-conductor coaxial connectors. These connectors provide DC, digital, and RF inputs/outputs for the BBXs in the SCCP backplane.

CIO Connectors

- RF RX antenna path signal inputs are routed through RX paths of the DRDCs or TRDCs at the RF interface panel (rear of frame), and through coaxial cables to the two MPC modules. The three “A” (main) signals go to one MPC; the three “B” (diversity) to the other. The MPC outputs the low-noise-amplified signals through the SCCP backplane to the CIO where the signals are split and sent to the appropriate BBX.
- A digital bus then routes the baseband signal through the BBX, to the backplane, and then on to the MCC slots.
- Digital TX antenna path signals originate at the MCCs. Each output is routed from the MCC slot through the backplane to the appropriate BBX.
- TX RF path signal originates from the BBX, travels through the backplane to the CIO, through the CIO, and then through multi-conductor coaxial cabling to the trunking module and LPAs in the LPA shelf.

SCCP Backplane Troubleshooting Procedure

The following tables provide standard procedures for troubleshooting problems that appear to be related to a defective SCCP backplane. The tables are broken down into possible problems and steps which should be taken in an attempt to find the root cause.

NOTE

All steps in all tables should be followed before any attempt to replace the SCCP backplane.

Digital Control Problems

No GLI Control via LMF (all GLIs)

Table 6-19: No GLI Control Through LMF (All GLIs)	
Step	Action
1	Check the Ethernet LAN for proper connection, damage, shorts, or opens.
2	Be sure the LAN IN and OUT connectors in the power entry compartment are properly terminated.
3	Be sure the proper IP address is entered in the Network Login tab of the LMF login screen.
4	Logout and Exit the LMF, restart the LMF, and re-login to the BTS.
5	Verify SCCP backplane Shelf ID DIP switch is set correctly.
6	Visually check the master GLI connectors (both module and backplane) for damage.
7	Replace the master GLI with a known good GLI.

No GLI Control through Span Line Connection (All GLIs)

Table 6-20: No GLI Control Through Span Line Connection (Both GLIs)	
Step	Action
1	Verify SCCP backplane Shelf ID DIP switch is set correctly.
2	Verify that the BTS and GLIs are correctly configured in the OMCR/CBSC database.
3	Verify the span configurations set in the GLIs match those in the OMC-R/CBSC database (refer to Table 6-31).
4	Visually check the master GLI connectors (both module and backplane) for damage.
5	Replace the master GLI with a known good GLI.
6	Check the span line cabling from the punchblock to the master GLI for proper connection and damage.

Table 6-21: MGLI Control Good – No Control Over Co-located GLI

Step	Action
1	Verify that the BTS and GLIs are correctly configured in the OMCR/CBSC data base.
2	Check the ethernet for proper connection, damage, shorts, or opens.
3	Visually check all GLI connectors (both module and backplane) for damage.
4	Replace the remaining GLI with a known good GLI.

No AMR Control (MGLI good)

Table 6-22: MGLI Control Good – No Control Over AMR	
Step	Action
1	Visually check the master GLI connectors (both module and backplane) for damage.
2	Replace the master GLI with a known good GLI.
3	Replace the AMR with a known good AMR.

No BBX Control in the Shelf**Table 6-23:** MGLI Control Good – No Control over Co-located BBXs

Step	Action
1	Visually check all GLI connectors (both module and backplane) for damage.
2	Replace the remaining GLI with a known good GLI.
3	Visually check BBX connectors (both module and backplane) for damage.
4	Replace the BBX with a known good BBX.

No (or Missing) Span Line Traffic**Table 6-24:** BBX Control Good – No (or Missing) Span Line Traffic

Step	Action
1	Visually check all GLI connectors (both module and backplane) for damage.
2	Replace the remaining GLI with a known good GLI.
3	Visually check all span line distribution (both connectors and cables) for damage.
4	If the problem seems to be limited to one BBX, replace the BBX with a known good BBX.

No (or Missing) MCC24E/MCC8E Channel Elements**Table 6-25:** No MCC-1X/MCC24E/MCC8E Channel Elements

Step	Action
1	Verify channel elements on a co-located MCC of the same type (CDF MccType codes: MCC8E = 0; MCC24E = 2; MCC-1X = 3)
2	Check MCC connectors (both module and backplane) for damage.
3	If the problem seems to be limited to one MCC, replace it with a known good MCC of the same type.
4	If no channel elements on <i>any</i> MCC, verify clock reference to CIO.

DC Power Problems

WARNING Potentially lethal voltage and current levels are routed to the BTS equipment. This test must be carried out with a second person present, acting in a safety role. Remove all rings, jewelry, and wrist watches prior to beginning this test.

No DC Input Voltage to SCCP Shelf Power Supply Modules

Table 6-26: No DC Input Voltage to Power Supply Module

Step	Action
1	Verify DC power is applied to the frame. Determine if any circuit breakers are tripped. NOTE If a breaker has tripped, remove all modules from the SCCP shelf and attempt to reset it. – If breaker trips again, there is probably a cable or breaker problem within the frame or DC PDA. – If breaker does not trip, there is probably a defective module or sub-assembly within the shelf. Perform the tests in Table 2-3 to attempt to isolate the module.
2	Verify that the PS1 and PS2 circuit breakers on the DC PDA are functional.
3	Remove the frame rear access panel (Figure 2-2), and use a voltmeter to determine if the input voltage is being routed to the SCCP backplane. Measure the DC voltage level between: • The PWR_IN_A and PWR_RTN_A contacts on the extreme right side at the rear of the backplane • The PWR_IN_B and PWR_RTN_B contacts on the extreme right side at the rear of the backplane – If the voltage is not present, there is probably a cable or circuit breaker problem within the frame or DC PDA.
4	If everything appears to be correct, visually inspect the PS1 and PS2 power supply module connectors.
5	Replace the power supply modules with known good modules.
6	If steps 1 through 4 fail to indicate a problem, an SCCP backplane failure has occurred (possibly an open trace).

No DC Voltage (+5, +6.5, or +15 Volts) to a Specific GLI, BBX, or Switch Module**Table 6-27:** No DC Input Voltage to any SCCP Shelf Module

Step	Action
1	If it has not been done, perform the steps in Table 6-26.
2	Inspect SCCP shelf module connectors (both module and backplane) for damage.
3	Replace suspect modules with known good module.

TX and RX Signal Routing Problems**Table 6-28:** TX and RX Signal Routing Problems

Step	Action
1	Inspect all Harting cable connectors and backplane connectors for damage in all the affected board slots.
2	Perform steps outlined in the RF path troubleshooting flowchart in Figure 6-1.

Troubleshooting: RFDS

Introduction

The RFDS is used to perform Pre-Calibration Verification and Post-Calibration Audits which limit-check the RFDS-generate and reported receive levels of every path from the RFDS through the directional coupler coupled paths. In the event of test failure, refer to the following tables.

All Tests Fail

Table 6-29: RFDS Fault Isolation – All Tests Fail

Step	Action
1	Check the TX calibration equipment for proper operation by manually setting the signal generator output attenuator to the lowest output power setting and connecting the output port to the spectrum analyzer RF input port.
2	Set the signal generator output attenuator to –90 dBm, and switch on the RF output. Verify that the spectrum analyzer can receive the signal, indicate the correct signal strength, (accounting for the cable insertion loss), and the approximate frequency.
3	Visually inspect RF cabling. Make sure each directional coupler forward and reflected port connects to the RFDS antenna select unit on the RFDS.
4	Check the wiring against the site documentation wiring diagram or the <i>SC4812ET Lite Installation; 68P09253A36</i> .
5	Verify any changes to the RFDS parameter settings have been downloaded.
6	Status the TSU to verify the TSIC and SUA software versions are correct.
7	Check to see that all RFDS boards show green on the front panel LED indicators. Visually check for external damage.
8	If any board LEDs do not show green, replace the RFDS with a known-good unit. Re-test after replacement.

All RX and TX Paths Fail

If every receive or transmit path fails, the problem most likely lies with the rf converter board or the transceiver board. Replace the RFDS with a known-good unit and retest.

All Tests Fail on a Single Antenna

If all path failures are on one antenna port, forward and/or reflected, make the following checks.

Table 6-30: RFDS Fault Isolation – All Tests Fail on Single Antenna Path	
Step	Action
1	Visually inspect the frame internal RFDS cabling to the suspect TRDC or DRDC.
2	Verify the forward and reflected ports connect to the correct RFDS antenna select unit positions on the RFDS ASU card. Refer to the RFDS installation manual for details.
3	Replace the RFDS with a known-good unit.
4	Replace the RF cables between the affected TRDC or DRDC and the RFDS.

Module Front Panel LED Indicators and Connectors

Module Status Indicators

Each of the non-passive plug-in modules has a bi-color (green and red) LED status indicator located on the module front panel. The indicator is labeled PWR/ALM. If both colors are turned on, the indicator is yellow.

Each plug-in module, except for the fan module, has its own alarm (fault) detection circuitry that controls the state of the PWR/ALM LED.

The fan TACH signal of each fan module is monitored by the AMR. Based on the status of this signal the AMR controls the state of the PWR/ALM LED on the fan module.

Module LED Status (except GLI2, CSM, BBX, MCC)

PWR/ALM LED

The following list describes the states of the module status indicator.

- Solid GREEN – module operating in a normal (fault free) condition.
- Solid RED – module is operating in a fault (alarm) condition due to electrical hardware failure.

Note that a fault (alarm) indication may or may not be due to a complete module failure and normal service may or may not be reduced or interrupted.

DC/DC Converter LED Status Combinations

The PWR CNVTR has its own alarm (fault) detection circuitry that controls the state of the PWR/ALM LED.

PWR/ALM LED

The following list describes the states of the bi-color LED.

- Solid GREEN – module operating in a normal (fault free) condition.
- Solid RED – module is operating in a fault (alarm) condition due to electrical hardware problem.

CSM LED Status Combinations

PWR/ALM LED

The CSMs include on-board alarm detection. Hardware and software/firmware alarms are indicated via the front panel indicators.

After the memory tests, the CSM loads OOS-RAM code from the Flash EPROM, if available. If not available, the OOS-ROM code is loaded from the Flash EPROM.

- Solid GREEN – module is INS_ACT or INS_SBY no alarm.
- Solid RED – Initial power up or module is operating in a fault (alarm) condition.
- Slowly Flashing GREEN – OOS_ROM no alarm.
- Long RED/Short GREEN – OOS_ROM alarm.
- Rapidly Flashing GREEN – OOS_RAM no alarm or INS_ACT in DUMB mode.
- Short RED/Short GREEN – OOS_RAM alarm.
- Long GREEN/Short RED – INS_ACT or INS_SBY alarm.
- Off – no DC power or on-board fuse is open.
- Solid YELLOW – After a reset, the CSMs begin to boot. During SRAM test and Flash EPROM code check, the LED is yellow. (If SRAM or Flash EPROM fail, the LED changes to a solid RED and the CSM attempts to reboot.)

Figure 6-2: CSM Front Panel Indicators & Monitor Ports

FREQ Monitor Connector

A test port provided at the CSM front panel via a BNC receptacle allows monitoring of the 19.6608 MHz clock generated by the CSM. When both CSM 1 and CSM 2 are in an in-service (INS) condition, the CSM 2 clock signal frequency is the same as that output by CSM 1.

The clock is a sine wave signal with a minimum amplitude of +2 dBm (800 mVpp) into a 50 Ω load connected to this port.

SYNC Monitor Connector

A test port provided at the CSM front panel via a BNC receptacle allows monitoring of the “Even Second Tick” reference signal generated by the CSMs.

At this port, the reference signal is a Transistor–Transistor Logic (TTL) active–high signal with a pulse width of 153 nanoseconds.

MMI Connector

Behind front panel – only accessible when card is partially extended from SCCP shelf slot. The RS–232 MMI port connector is intended to be used primarily in the development or factory environment, but may be used in the field for debug/maintenance purposes.

GLI2 LED Status Combinations

The GLI2 module indicators, controls, and connectors are described below and shown in Figure 6-3.

The indicators and controls consist of:

- Four LEDs
- One pushbutton

ACTIVE LED

Solid GREEN – GLI2 is active. This means that the GLI2 has shelf control and is providing control of the digital interfaces.

Off – GLI2 is not active (i.e., Standby). The mate GLI2 should be active.

MASTER LED

- Solid GREEN – GLI2 is Master (sometimes referred to as MGLI2).
- Off – GLI2 is non-master (i.e., Slave).

ALARM LED

- Solid RED – GLI2 is in a fault condition or in reset.
- While in reset transition, STATUS LED is OFF while GLI2 is performing ROM boot (about 12 seconds for normal boot).
- While in reset transition, STATUS LED is ON while GLI2 is performing RAM boot (about 4 seconds for normal boot).
- Off – No Alarm.

STATUS LED

- Flashing GREEN– GLI2 is in service (INS), in a stable operating condition.
- On – GLI2 is in OOS RAM state operating downloaded code.
- Off – GLI2 is in OOS ROM state operating boot code.

SPANS LED

- Solid GREEN – Span line is connected and operating.
- Solid RED – Span line is disconnected or a fault condition exists.

GLI2 Pushbuttons and Connectors

RESET Pushbutton – Depressing the RESET pushbutton causes a partial reset of the CPU and a reset of all board devices. GLI2 will be placed in the OOS_ROM state (blue).

MMI Connector – The RS-232MMI port connector is intended primarily for development or factory use but may be used in the field for debug/maintenance purposes.

Figure 6-3: GLI2 Front Panel Operating Indicators

LED	OPERATING STATUS
STATUS	OFF – operating normally ON – briefly during power-up when the Alarm LED turns OFF. SLOW GREEN – when the GLI2 is INS (in-service)
RESET	All functions on the GLI2 are reset when pressing and releasing the switch.
ALARM	OFF – operating normally ON – briefly during power-up when the Alarm LED turns OFF. SLOW GREEN – when the GLI2 is INS (in-service)
SPANS	OFF – card is powered down, in initialization, or in standby GREEN – operating normally YELLOW – one or more of the equipped initialized spans is receiving a remote alarm indication signal from the far end RED – one or more of the equipped initialized spans is in an alarm state
MASTER	The pair of GLI2 cards include a redundant status. The card in the top shelf is designated by hardware as the active card; the card in the bottom shelf is in the standby mode. ON – operating normally as active card OFF – operating normally as standby card
MMI PORT CONNECTOR	An RS-232, serial, asynchronous communications link for use as an MMI port. This port supports 300 baud, up to a maximum of 115,200 baud communications.
ACTIVE	Shows the operating status of the redundant cards. The redundant card toggles automatically if the active card is removed or fails ON – active card operating normally OFF – standby card operating normally

FW00225

BBX LED Status Combinations

PWR/ALM LED

The BBX2 and BBX-1X modules have their own alarm (fault) detection circuitry that controls the state of the PWR/ALM LED.

The following list describes the states of the bi-color PWR/ALM LED for both BBX2 and BBX-1X cards:

- Solid GREEN – INS_ACT no alarm
- Solid RED Red – initializing or power-up alarm
- Slowly Flashing GREEN – OOS_ROM no alarm
- Long RED/Short GREEN – OOS_ROM alarm
- Rapidly Flashing GREEN – OOS_RAM no alarm
- Short RED/Short GREEN – OOS_RAM alarm
- Long GREEN/Short RED – INS_ACT alarm

MCC LED Status Combinations

The MCC24E and MCC-1X modules have bi-color LED indicators and two connectors as described below. See Figure 6-4. Note that the figure does not show the connectors because they are concealed by the removable lens.

The LED indicators and their states are as follows:

PWR/ALM LED

- RED – fault on module

ACTIVE LED

- Off – module is inactive, off-line, or not processing traffic.
- Slowly Flashing GREEN – OOS_ROM no alarm.
- Rapidly Flashing Green – OOS_RAM no alarm.
- Solid GREEN – module is INS_ACT, on-line, processing traffic.

PWR/ALM and ACTIVE LEDs

- Solid RED – module is powered but is in reset or the Board Control Processor (BCP) is inactive.

MMI Connectors

- The RS-232 MMI port connector (four-pin) is intended primarily for development or factory use but may be used in the field for debugging purposes.
- The RJ-45 Ethernet port connector (eight-pin) is intended primarily for development use but may be used in the field for high data rate debugging purposes.

. . . continued on next page

Figure 6-4: MCC24 and MCC-1X Front Panel LEDs and LED Indications

LPA LED Status Combinations

LPA Module LED

Each LPA module is provided with a bi-color LED on the ETIB module next to the MMI connector. Interpret this LED as follows:

- GREEN — LPA module is active and is reporting no alarms (Normal condition).
- Flashing GREEN/RED — LPA module is active but is reporting an low input power condition. If no BBX is keyed, this is normal and does not constitute a failure.
- Flashing RED — LPA is in alarm.

Troubleshooting: Span Control Link

Span Problems (No Control Link)

Table 6-31: Troubleshoot Control Link Failure

✓	Step	Action
	1	Connect the LMF computer to the MMI port on the applicable MGLI2/GLI2 as shown in Figure 6-5.
	2	Start an MMI communication session with the applicable MGLI2/GLI2 by using the <i>Windows</i> desktop shortcut icon (refer to Table 3-10).
	3	Once the connection window opens, press the LMF computer Enter key until the GLI2> prompt is obtained.
	4	At the GLI2> prompt, enter: config ni current <cr> (equivalent of <code>span view</code> command) The system will respond with a display similar to the following: <pre>The frame format in flash is set to use T1_2. Equalization: Span A - Default (0-131 feet for T1/J1, 120 Ohm for E1) Span B - Default (0-131 feet for T1/J1, 120 Ohm for E1) Span C - Default (0-131 feet for T1/J1, 120 Ohm for E1) Span D - Default (0-131 feet for T1/J1, 120 Ohm for E1) Span E - Default (0-131 feet for T1/J1, 120 Ohm for E1) Span F - Default (0-131 feet for T1/J1, 120 Ohm for E1) Linkspeed: Default (56K for T1 D4 AMI, 64K otherwise) Currently, the link is running at the default rate The actual rate is 0</pre> NOTE Defaults for span equalization are 0–131 feet for T1/J1 spans and 120 Ohm for E1. Default linkspeed is 56K for T1 D4 AMI spans and 64K for all other types. There is no need to change from defaults unless the OMCR/CBSC span configuration requires it.
	5	The span configurations loaded in the GLI must match those in the OMCR/CBSC database for the BTS. If they do not, proceed to Table 6-32.
	6	Repeat steps 1 through 5 for all remaining GLIs.
	7	If the span settings are correct, verify the edlc parameters using the <code>show</code> command. Any alarm conditions indicate that the span is not operating correctly. • Try looping back the span line from the DSX panel to the MM, and verify that the looped signal is good. • Listen for control tone on the appropriate timeslot from the Base Site and MM.
	8	Exit the GLI MMI session and HyperTerminal connection by selecting File from the connection window menu bar, and then Exit from the pull-down menu.

Figure 6-5: MGLI/GLI Board MMI Connection Detail

6

Set BTS Site Span Configuration

NOTE

Perform the following procedure *ONLY* if span configurations loaded in the MGLI2/GLI2s do not match those in the OMCR/CBSC data base, *AND ONLY* when the exact configuration data is available. Loading incorrect span configuration data will render the site inoperable.

Table 6-32: Set BTS Span Parameter Configuration

✓	Step	Action
	1	If not previously done, connect the LMF computer to the MMI port on the applicable MGLI2/GLI2 as shown in Figure 6-5.
	2	If there is no MMI communication session in progress with the applicable MGLI2/GLI2, initiate one by using the <i>Windows</i> desktop shortcut icon (refer to Table 3-10).
	3	At the GLI2> prompt, enter: config ni format <option> <cr> The terminal will display a response similar to the following: <pre> COMMAND SYNTAX: config ni format option Next available options: LIST - option : Span Option E1_1 : E1_1 - E1 HDB3 CRC4 no TS16 E1_2 : E1_2 - E1 HDB3 no CRC4 no TS16 E1_3 : E1_3 - E1 HDB3 CRC4 TS16 E1_4 : E1_4 - E1 HDB3 no CRC4 TS16 T1_1 : T1_1 - D4, AMI, No ZCS T1_2 : T1_2 - ESF, B8ZS J1_1 : J1_1 - ESF, B8ZS (Japan) - Default J1_2 : J1_2 - ESF, B8ZS T1_3 : T1_3 - D4, AMI, ZCS> </pre> NOTE With this command, all active (in-use) spans will be set to the same format.
	4	To set or change the span type, enter the correct option from the list at the entry prompt (>), as shown in the following example: > T1_2 <cr> NOTE The entry is case-sensitive and must be typed <i>exactly</i> as it appears in the list. If the entry is typed incorrectly, a response similar to the following will be displayed: <pre> CP: Invalid command GLI2> </pre>
	5	An acknowledgement similar to the following will be displayed: The value has been programmed. It will take effect after the next reset. GLI2>

... continued on next page

Table 6-32: Set BTS Span Parameter Configuration

✓	Step	Action
	6	If the current MGLI/GLI span rate must be changed, enter the following MMI command: config ni linkspeed <cr> The terminal will display a response similar to the following: Next available options: <pre>LIST - linkspeed : Span Linkspeed 56K : 56K (default for T1_1 and T1_3 systems) 64K : 64K (default for all other span configurations)</pre> > NOTE With this command, all active (in-use) spans will be set to the same linkspeed.
	7	To set or change the span linkspeed, enter the required option from the list at the entry prompt (>), as shown in the following example: > 64K <cr> NOTE The entry is case-sensitive and must be typed <i>exactly</i> as it appears in the list. If the entry is typed incorrectly, a response similar to the following will be displayed: <pre>CP: Invalid command GLI2></pre>
	8	An acknowledgement similar to the following will be displayed: <pre>The value has been programmed. It will take effect after the next reset. GLI2></pre>
	9	If the span equalization must be changed, enter the following MMI command: config ni equal <cr> The terminal will display a response similar to the following: <pre>COMMAND SYNTAX: config ni equal span equal Next available options: LIST - span : Span a : Span A b : Span B c : Span C d : Span D e : Span E f : Span F</pre> >

... continued on next page

Table 6-32: Set BTS Span Parameter Configuration

✓	Step	Action
	10	At the entry prompt (>), enter the designator from the list for the span to be changed as shown in the following example: > a <cr> The terminal will display a response similar to the following: <pre> COMMAND SYNTAX: config ni equal a equal Next available options: LIST - equal : Span Equalization 0 : 0-131 feet (default for T1/J1) 1 : 132-262 feet 2 : 263-393 feet 3 : 394-524 feet 4 : 525-655 feet 5 : LONG HAUL 6 : 75 OHM 7 : 120 OHM (default for E1) </pre> >
	11	At the entry prompt (>), enter the code for the required equalization from the list as shown in the following example: > 0 <cr> The terminal will display a response similar to the following: <pre> > 0 The value has been programmed. It will take effect after the next reset. GLI2> </pre>
	12	Repeat steps 9 through 11 for each in-use span.
	13	* IMPORTANT After executing the config ni format, config ni linkspeed, and/or config ni equal commands, the affected MGLI/GLI board <i>MUST</i> be reset and reloaded for changes to take effect. Although defaults are shown, <i>always</i> consult site specific documentation for span type and linkspeed used at the site. Press the RESET button on the MGLI2/GLI2 for changes to take effect.

... continued on next page

Table 6-32: Set BTS Span Parameter Configuration

✓	Step	Action
	14	Once the MGLI/GLI has reset, execute the following command to verify span settings are as required: config ni current <cr> (equivalent of <code>span view</code> command) The system will respond with a display similar to the following: The frame format in flash is set to use T1_2. Equalization: Span A - 0-131 feet Span B - 0-131 feet Span C - Default (0-131 feet for T1/J1, 120 Ohm for E1) Span D - Default (0-131 feet for T1/J1, 120 Ohm for E1) Span E - Default (0-131 feet for T1/J1, 120 Ohm for E1) Span F - Default (0-131 feet for T1/J1, 120 Ohm for E1) Linkspeed: 64K Currently, the link is running at 64K The actual rate is 0
	15	If the span configuration is not correct, perform the applicable step from this table to change it and repeat steps 13 and 14 to verify required changes have been programmed.
	16	Return to step 6 of Table 6-31.

PN Offset/I & Q Offset Register Programming Information

PN Offset Programming Information

PN Offset Background

All channel elements transmitted from a BTS in a particular 1.25 MHz CDMA channel are orthonogonally spread by 1 of 64 possible Walsh code functions; additionally, they are also spread by a quadrature pair of PN sequences unique to each sector.

Overall, the mobile uses this to differentiate multiple signals transmitted from the same BTS (and surrounding BTS) sectors, and to synchronize to the next strongest sector.

The PN offset per sector is stored on the BBXs, where the corresponding I & Q registers reside.

The PN offset values are determined by BTS sector (antenna) based on the applicale CDF data field content. A breakdown of this information is found in Table B-1.

PN Offset Usage

There are three basic RF chip delays currently in use. It is important to determine what RF chip delay is valid to be able to test the BTS functionality. This can be done by ascertaining if the CDF `FineTxAdj` value was set to “on” when the MCC was downloaded with “image data”. The `FineTxAdj` value is used to compensate for the processing delay (approximately 20 μ S) in the BTS using any type of mobile meeting IS-97 specifications.

Observe the following guidelines:

- If the `FineTxAdj` value in the CDF is 101 (65 HEX), the `FineTxAdj` has not been set. The I and Q values from the 0 table **MUST** be used.

If the `FineTxAdj` value in the cdf file is 213 (D5 HEX), `FineTxAdj` has been set for the *14 chip table*.

- If the `FineTxAdj` value in the CDF file is 197 (C5 HEX), `FineTxAdj` has been set for the *13 chip table*.

NOTE	CDF file I and Q values can be represented in DECIMAL or HEX. If using HEX, add 0x before the HEX value. If necessary, convert HEX values in Table B-1 to decimal before comparing them to cdf file I & Q value assignments.
-------------	--

- If a Qualcomm mobile is used, select I and Q values from the 13 chip delay table.
- If a mobile is used that does not have the 1 chip offset problem, (any mobile meeting the IS-97 specification), select from the 14 chip delay table.

NOTE	If the wrong I and Q values are used with the wrong <code>FineTxAdj</code> parameter, system timing problems will occur. This will cause the energy transmitted to be “smeared” over several Walsh codes (instead of the single Walsh code that it was assigned to), causing erratic operation. Evidence of smearing is usually identified by Walsh channels not at correct levels or present when not selected in the Code Domain Power Test.

FRU Optimization/ATP Test Matrix

FRU Optimization/ATP Test Matrix

Usage & Background

Periodic maintenance of a site may also mandate re-optimization of specific portions of the site. An outline of some basic guidelines is included in the following tables.

NOTE	Re-optimization steps listed for any assembly detailed in the tables below must be performed <i>anytime</i> an RF cable associated with it is replaced.
-------------	---

Detailed Optimization/ATP Test Matrix

Table C-1 outlines in more detail the tests that would need to be performed if one of the BTS components were to fail and be replaced. It is also assumes that all modules are placed OOS-ROM via the LMF until full redundancy of all applicable modules is implemented.

The following guidelines should also be noted when using this table:

NOTE	Not every procedure required to bring the site back in service is indicated in Table C-1. It is meant to be used as a guideline ONLY. The table assumes that the user is familiar enough with the BTS Optimization/ATP procedure to understand which test equipment set ups, calibrations, and BTS site preparation will be required before performing the Table # procedures referenced.
-------------	---

Passive BTS components (such as the bandpass filters and 2:1 combiners) only require a TX calibration audit to be performed in lieu of a full path calibration. If the TX path calibration audit fails, the entire RF path calibration will need to be repeated. If the RF path calibration fails, further troubleshooting is warranted.

NOTE	If any significant change in signal level results from any component being replaced in the RX or TX signal flow paths, it would be identified by re-running the RX and TX calibration audit command.
-------------	--

When the CIO is replaced, the SCCP shelf remains powered up. The BBX boards may need to be removed, then re-installed into their original slots, and re-downloaded (code and BLO data). RX and TX calibration audits should then be performed on the affected carrier sectors.

Table C-1: SC 4812ET Lite BTS Optimization and ATP Test Matrix

Table C-1: SC 4812ET Lite BTS Optimization and ATP Test Matrix																							
Doc Tbl #	Description	DRDC or TRDC	RX Cables	TX Cables	MPC / EMPC	CIO	SCCP Shelf Assembly (Backplane)	BBX2/IBBX-1X	MCC24E/MCC8E/MCC-1X	CSM/GPS	LFR	HSO/HSOX	50-pair Punchblock (with RGPS)	RGD/20-pair Punchblock with RGD	CCD Card	GLI2	ETIB or Associated Cables	LPAC Cable	LPA or LPA Trunking Module	LPA Bandpass Filter or Combiner	Switch Card	RFDS Cables	RFDS
OPTIMIZATION AND TEST LEGEND:																							
● Required * Perform if determined necessary for additional fault isolation, repair assurance, or required for site certification.																							
- Perform on all carrier and sector TX paths to the SCCP cage. - Perform on all carrier and sector main and diversity RX paths to the SCCP cage. - Perform on all primary and redundant TX paths of the affected carrier. (LPAC replacement affects all carriers.) - Perform on the affected carrier and sector TX path(s) (BBXR replacement affects <i>all</i> carrier and sector TX paths). - Perform on the affected carrier and sector RX path(s) (BBXR replacement affects <i>all</i> carrier RX paths). - Perform on <i>all RF paths</i> of the affected carrier and sector (RFDS replacement affects all carriers). - Perform with <i>redundant</i> BBX for <i>at least</i> one sector on one carrier. - Verify performance by performing on one sector of one carrier only. - Perform only if RGD/RGPS, LFR antenna, or HSO or LFR expansion was installed. - Verify performance by performing testing on one sector of <i>each</i> carrier.																							

Appendix D

BBX Gain Set Point vs. BTS Output

BBX Gain Set Point vs. BTS Output

Usage & Background

Table D-1 outlines the relationship between the *total* of all code domain channel element gain settings (digital root sum of the squares) and the BBX Gain Set Point between 33.0 dBm and 44.0 dBm. The resultant RF output (as measured in dBm at the BTS antenna connector) is shown in the table. The table assumes that the BBX Bay Level Offset (BLO) values have been calculated.

As an illustration, consider a BBX keyed up to produce a CDMA carrier with only the Pilot channel (no MCCs forward link enabled). Pilot gain is set to 262. In this case, the BBX Gain Set Point is shown to correlate exactly to the actual RF output anywhere in the 33 to 44 dBm output range. (This is the level used to calibrate the BTS).

Table D-1: BBX Gain Set Point vs. Actual BTS Output (in dBm)												
dBm↗ Gain↘	44	43	42	41	40	39	38	37	36	35	34	33

Appendix E

CDMA Operating Frequency Information

CDMA Operating Frequency Programming Information

Introduction

Programming of each of the BTS BBX synthesizers is performed by the BTS GLI2s via the Concentration Highway Interface (CHI) bus. This programming data determines the transmit and receive transceiver operating frequencies (channels) for each BBX.

1900 MHz PCS Channels

Figure E-1 shows the valid channels for the North American PCS 1900 MHz frequency spectrum. There are 10 CDMA wireline or non-wireline band channels used in a CDMA system (unique per customer operating system).

Figure E-1: North America PCS Frequency Spectrum (CDMA Allocation)

■

E

■

Calculating 1900 MHz Center Frequencies

Table E-1 shows selected 1900 MHz CDMA candidate operating channels, listed in both decimal and hexadecimal, and the corresponding transmit, and receive frequencies. Center frequencies (in MHz) for channels not shown in the table may be calculated as follows:

- $TX = 1930 + 0.05 * \text{Channel\#}$
Example: Channel 262
 $TX = 1930 + 0.05 * 262 = 1943.10 \text{ MHz}$
- $RX = TX - 80$
Example: Channel 262
 $RX = 1943.10 - 80 = 1863.10 \text{ MHz}$

Actual frequencies used depend on customer CDMA system frequency plan.

Each CDMA channel requires a 1.77 MHz frequency segment. The actual CDMA carrier is 1.23 MHz wide, with a 0.27 MHz guard band on both sides of the carrier.

Minimum frequency separation required between any CDMA carrier and the nearest NAMPS/AMPS carrier is 900 kHz (center-to-center).

Table E-1: 1900 MHz TX and RX Frequency vs. Channel

Channel Number Decimal	Hex	Transmit Frequency (MHz) Center Frequency	Receive Frequency (MHz) Center Frequency
25	0019	1931.25	1851.25

800 MHz CDMA Channels

Figure E-2 shows the valid channels for the North American cellular telephone frequency spectrum. There are 10 CDMA wireline or non-wireline band channels used in a CDMA system (unique per customer operating system).

Figure E-2: North American Cellular Telephone System Frequency Spectrum (CDMA Allocation).

FW00402

Calculating 800 MHz Center Frequencies

Table E-2 shows selected 800 MHz CDMA candidate operating channels, listed in both decimal and hexadecimal, and the corresponding transmit, and receive frequencies. Center frequencies (in MHz) for channels not shown in the table may be calculated as follows:

- Channels 1–777
 $TX = 870 + 0.03 * \text{Channel\#}$
Example: Channel 262
 $TX = 870 + 0.03 * 262 = 877.86 \text{ MHz}$
- Channels 1013–1023
 $TX = 870 + 0.03 * (\text{Channel\#} - 1023)$
Example: Channel 1015
 $TX = 870 + 0.03 * (1015 - 1023) = 869.76 \text{ MHz}$
- $RX = TX - 45 \text{ MHz}$
Example: Channel 262
 $RX = 877.86 - 45 = 832.86 \text{ MHz}$

Table E-2: 800 MHz TX and RX Frequency vs. Channel			
Channel Number Decimal Hex		Transmit Frequency (MHz) Center Frequency	Receive Frequency (MHz) Center Frequency
1	0001	870.0300	825.0300

Appendix F

Test Equipment Preparation

Test Equipment Preparation

Purpose

This appendix provides information on pre-testing set-up for the following test equipment items (not required for the Cybertest test set):

- Agilent E4406A transmitter test set
- Agilent E4432B signal generator
- Advantest R3267 spectrum analyzer
- Advantest R3562 signal generator
- Agilent 8935 analyzer (formerly HP 8935)
- HP 8921 with PCS interface analyzer
- Advantest R3465 analyzer
- Motorola CyberTest
- HP 437 power meter
- Gigatronix 8541C power meter
- GPIB adapter

Pre-testing set-up information covered includes verification and setting GPIB addresses, inter-unit cabling, connectivity testing, pre-test control settings, and equipment calibration for items which are not calibrated with the **Calibrate Test Equipment** function of the LMF.

The following procedures cover verification and changing GPIB addresses for the various items of CDMA test equipment supported by the LMF.

Verifying and Setting GPIB Addresses

Agilent E4406A Transmitter Tester GPIB Address

Refer to Figure F-1 and follow the procedure in Table F-1 to verify and, if necessary, change the Agilent E4406A GPIB address.

Figure F-1: Setting Agilent E4406A GPIB Address

ti-CDMA-WP-00085-v01-ildoc-ftw

Table F-1: Verify and Change Agilent E4406A GPIB Address

Step	Action
1	In the SYSTEM section of the instrument front panel, press the System key. The softkey labels displayed on the right side of the instrument screen will change.
2	Press the Config I/O softkey button to the right of the instrument screen. - The softkey labels will change. - The current instrument GPIB address will be displayed below the GPIB Address softkey label.
3	If the current GPIB address is not set to 18 , perform the following to change it:
3a	Press the GPIB Address softkey button. In the on-screen Active Function Area, GPIB Address will be displayed followed by the current GPIB address.
3b	On front panel Data Entry keypad, enter the communications system analyzer GPIB address of 18 . - The GPIB Address label will change to Enter. - Characters typed with the keypad will replace the current GPIB address in the Active Function Area. NOTE To correct an entry, press Bk Sp key to delete one character at a time.
3c	Press the Enter softkey button or the keypad Enter key to set the new GPIB address. - The Config I/O softkey labels will reappear. - The new GPIB address will be displayed under the GPIB Address softkey label.

F

Agilent E4432B Signal Generator GPIB Address

Refer to Figure F-2 and follow the procedure in Table F-2 to verify and, if necessary, change the Agilent E4432B GPIB address.

Figure F-2: Setting Agilent E4432B GPIB Address

Table F-2: Verify and Change Agilent E4432B GPIB Address

Step	Action
1	In the MENUS section of the instrument front panel, press the Utility key. The softkey labels displayed on the right side of the instrument screen will change.
2	Press the GPIB/RS232 softkey button to the right of the instrument screen. - The softkey labels will change. - The current instrument GPIB address will be displayed below the GPIB Address softkey label.
3	If the current GPIB address is not set to 1 , perform the following to change it:
3a	Press the GPIB Address softkey button. - The GPIB Address label and current GPIB address will change to boldface. - In the on-screen Active Entry Area, Address: will be displayed followed by the current GPIB address.
3b	On the front panel Numeric keypad, enter the signal generator GPIB address of 1 . - The GPIB Address label will change to Enter. - Characters typed on the keypad will replace the current GPIB address in the Active Entry display. NOTE To correct an entry, press the backspace key at the lower right of the keypad to delete one character at a time.
3c	Press the Enter softkey button to set the new GPIB address. The new GPIB address will be displayed under the GPIB Address softkey label.

Advantest R3267 Spectrum Analyzer GPIB Address

Refer to Figure F-3 and perform the procedure in Table F-3 to verify and, if necessary, change the Advantest R3267 spectrum analyzer GPIB address.

Figure F-3: Setting Advantest R3267 GPIB Address

Table F-3: Verify and Change Advantest R3267 GPIB Address	
Step	Action
1	If the REMOTE LED is lighted, press the LCL key. – The LED extinguishes.
2	Press the CONFIG key. – CONFIG softkey labels will appear in the softkey label display area of the instrument display. – The current GPIB address will be displayed below the GPIB Address softkey label.
3	If the current GPIB address is not set to 18 , perform the following to change it:
3a	Press the GPIB Address softkey. A GPIB Address entry window will open in the instrument display showing the current GPIB address.
3b	Enter 18 on the keypad in the ENTRY section of the instrument front panel. – Characters typed on the keypad will replace the address displayed in the GPIB Address entry window. NOTE To correct an entry, press the BS (backspace) key at the lower right of the keypad to delete one character at a time.
3c	Press the ENTR key to the lower right of the keypad to set the new GPIB address. – The GPIB Address entry window closes. – The new address is displayed in the bottom portion of the GPIB Address softkey label.

F

Advantest R3562 Signal Generator GPIB Address

Set the **GP-IB ADDRESS** switch on the rear of the Advantest R3562 signal generator to address **1** as shown in Figure F-4.

Figure F-4: Advantest R3562 GPIB Address Switch Setting

Agilent 8935 Series E6380 (formerly HP 8935) Test Set GPIB Address

Refer to Figure F-5 and follow the procedure in Table F-4 to verify and, if necessary, change the Agilent 8935 GPIB address.

Figure F-5: Agilent 8935 Test Set

FW00885

NOTE This procedure assumes that the test equipment is set up and ready for testing.

Table F-4: Verify and/or Change Agilent 8935 (formerly HP 8935) GPIB Address	
Step	Action
1	NOTE The HP I/O configuration MUST be set to Talk & Listen, or <i>no</i> device on the GPIB will be accessible. (Consult test equipment OEM documentation for additional information as required.) To verify that the GPIB addresses are set correctly, press Shift and LOCAL on the Agilent 8935. – The current HP-IB address is displayed at the top of the screen. NOTE HP-IB is the same as GPIB.
2	If the current GPIB address is not set to 18 , perform the following to change it:
2a	– Press Shift and Inst Config .
2b	– Turn the Cursor Control knob to move the cursor to the HP-IB Adrs field.
2c	– Press the Cursor Control knob to select the field.
2d	– Turn the Cursor Control knob as required to change the address to 18 .
2e	– Press the Cursor Control knob to set the address.
3	Press Preset to return to normal operation.

F

Hewlett Packard HP8921A and HP83236A/B GPIB Address

Refer to Figure F-6 and follow the procedure in Table F-5 to verify and, if necessary, change the HP 8921A HP 83236A GPIB addresses.

Figure F-6: HP 8921A and HP 83236A/B

NOTE This procedure assumes that the test equipment is set up and ready for testing.

Table F-5: Verify and/or Change HP 8921A and HP 83236A GPIB Addresses

Step	Action
1	To verify that the GPIB addresses are set correctly, press Shift and LOCAL on the HP 8921A. – The current HP-IB address is displayed at the top of the screen. NOTE HP-IB is the same as GPIB.
2	If the current HP-IB address is not set to 18 , perform the following to change it:
2a	– Turn the Cursor Control knob to move the cursor to More and press the knob to select the field.
2b	– Turn the Cursor Control knob to move the cursor to I/O Config and press the knob to select the field.
2c	– Turn the Cursor Control knob to move the cursor to Adrs and press the knob to select the field.
2d	– Turn the Cursor Control knob to change the HP-IB address to 18 and press the knob to set the address.
2e	– Press Shift and Preset to return to normal operation.
3	To set the HP 83236A (or B) PCS Interface GPIB address= 19 , set the DIP switches as follows: – A1=1, A2=1, A3=0, A4=0, A5=1, HP-IB/Ser = 1

Advantest R3465 Communications Test Set GPIB Address

Refer to Figure F-7 and follow the procedure in Table F-6 to verify and, if necessary, change the GPIB address for the Advantest R3465.

Figure F-7: R3465 Communications Test Set

NOTE This procedure assumes that the test equipment is set up and ready for testing.

F

Table F-6: Verify and/or Change Advantest R3465 GPIB Address	
Step	Action
1	To verify that the GPIB address is set correctly, perform the following:
1a	– Press SHIFT then PRESET .
1b	– Press LCL .
1c	– Press the GPIB and Others CRT menu key to view the current address.
2	If the current GPIB address is not set to 18 , perform the following to change it:
2a	– Turn the vernier knob as required to select 18 .
2b	– Press the vernier knob to set the address.
3	To return to normal operation, press Shift and Preset .

Motorola CyberTest GPIB Address

Follow the steps in Table F-7 to verify and, if necessary, change the GPIB address on the Motorola CyberTest. Changing the GPIB address requires the following items:

- Motorola CyberTest communications analyzer.
- Computer running Windows 3.1/Windows 95.
- Motorola CyberTAME software program “TAME”.
- Parallel printer port cable (shipped with CyberTest).

NOTE	This procedure assumes that the test equipment is set up and ready for testing.
-------------	---

Table F-7: Verify and/or Change Motorola CyberTest GPIB Address

Step	Action
1	On the LMF desktop, locate the CyberTAME icon. Double click on the icon to run the CyberTAME application.
2	In the CyberTAME window taskbar, under Special , select IEEE.488.2 .
3	CyberTAME software will query the CyberTest Analyzer for its current GPIB address. It then will open the IEEE 488.2 dialog box. If the current GPIB address is not 18 , perform the following procedure to change it:
3a	Use the up or down increment arrows or double-click in the field and type the number to set the address to 18 .
3b	Click on the OK button. The new address will be written to the CyberTest through the parallel port and saved.
4	Verify that the address has been set by repeating steps 2 and 3. The new address should now appear in the IEEE 488.2 dialog box Address field.

HP 437 Power Meter GPIB Address

Refer to Figure F-8 and follow the steps in Table F-8 to verify and, if necessary, change the HP 437 GPIB address.

Figure F-8: HP 437 Power Meter

NOTE This procedure assumes that the test equipment is set up and ready for testing.

Table F-8: Verify and/or Change HP 437 Power Meter GPIB Address	
Step	Action
1	Press Shift and PRESET .
2	Use the  arrow key to navigate to HP–IB ADRS and press ENTER . The HP–IB address is displayed. NOTE HP–IB is the same as GPIB.
3	If the current GPIB address is not set to 13 , perform the following to change it: – Use the   arrow keys to change the HP–IB ADRS to 13. – Press ENTER to set the address.
4	Press Shift and ENTER to return to a standard configuration.

F

Gigatronics 8541C Power Meter GPIB Address

Refer to Figure F-9 and follow the steps in Table F-9 to verify and, if necessary, change the Gigatronics 8541C power meter GPIB address.

Figure F-9: Gigatronics 8541C Power Meter Detail

REF FW00564

NOTE This procedure assumes that the test equipment is set up and ready for testing.

Table F-9: Verify and/or Change Gigatronics 8541C Power Meter GPIB Address

Step	Action
1	! CAUTION Do not connect/disconnect the power meter sensor cable with AC power applied to the meter. Disconnection could result in destruction of the sensing element or miscalibration. Press MENU .
2	Use the  arrow key to select CONFIG MENU and press ENTER .
3	Use the  arrow key to select GPIB and press ENTER . The current Mode and GPIB Address are displayed.
4	If the Mode is not set to 8541C , perform the following to change it: Use the   arrow keys as required to select MODE . Use the   arrow keys as required to set MODE to 8541C .
5	If the GPIB address is not set to 13 , perform the following to change it: Use the  arrow key to select ADDRESS . Use the   arrow keys as required to set the GPIB address to 13 .
6	Press ENTER to return to normal operation.

F

RS232 GPIB Interface Adapter

Be sure that the RS-232 GPIB interface adapter DIP switches are set as shown in Figure F-10.

Figure F-10: RS232 GPIB Interface Adapter

Test Equipment Inter-unit Connection, Testing, and Control

Inter-unit Connection, Testing, and Control Settings

The following illustrations, tables, and procedures provide the information necessary to prepare various items of CDMA test equipment supported by the LMF for BTS calibration and/or acceptance testing.

HP 8921A with PCS Interface Test Equipment Connections

The following diagram depicts the rear panels of the HP 8921A test equipment as configured to perform automatic tests. All test equipment is controlled by the LMF via an IEEE-488/GPIB bus. The LMF expects each piece of test equipment to have a factory-set GPIB address (refer to Table F-5 and Figure F-6). If there is a communications problem between the LMF and any piece of test equipment, verify that the GPIB addresses have been set correctly and that the GPIB cables are firmly connected to the test equipment.

Figure F-11 shows the connections when *not using* an external 10 MHz Rubidium reference.

Table F-10: HP 8921A/600 Communications Test Set Rear Panel Connections Without Rubidium Reference

From Test Set:	To Interface:		Connector Type
	83203B CDMA	83236A PCS	
CW RF OUT	CW RF IN		SMC-female – SMC-female
114.3 MHZ IF OUT	114.3 MHZ IF IN		SMC-female – SMC-female
IQ RF IN	IQ RF OUT		SMC-female – SMC-female
DET OUT	AUX DSP IN		SMC-female – SMC-female
CONTROL I/O	CONTROL I/O		45-pin custom BUS
10 MHZ OUT	SYNTH REF IN		BNC-male – BNC-male
HPIB INTERFACE		HPIB INTERFACE	HPIB cable
	10 MHZ OUT	REF IN	BNC-male – BNC-male

Figure F-11: HP 8921A/600 Cable Connections for 10 MHz Signal and GPIB without Rubidium Reference

F

Figure F-12 shows the connections when *using* an external 10 MHz Rubidium reference.

Table F-11: HP 8921A/600 Communications Test Set Rear Panel Connections With Rubidium Reference

From Test Set:	To Interface:		Connector Type
	83203B CDMA	83236A PCS

Figure F-12: HP 8921A Cable Connections for 10 MHz Signal and GPIB with Rubidium Reference

F

HP 8921A with PCS Interface System Connectivity Test

Follow the steps outlined in Table F-12 to verify that the connections between the PCS Interface and the HP 8921A are correct and cables are intact. The software also performs basic functionality checks of each instrument.

NOTE	Table:note. Note 10pt Helvetica Disconnect other GPIB devices, especially system controllers, from the system before running the connectivity software.
-------------	--

Table F-12: System Connectivity

Step	Action
	NOTE – Perform this procedure <i>after</i> test equipment has been allowed to warm-up and stabilize for a <i>minimum of 60 minutes</i> .
1	Insert HP 83236A Manual Control/System card into memory card slot.
2	Press the [PRESET] pushbutton.
3	Press the Screen Control [TESTS] pushbutton to display the “Tests” Main Menu screen.
4	Position the cursor at Select Procedure Location and select it by pressing the cursor control knob. In the Choices selection box, select Card .
5	Position the cursor at Select Procedure Filename and select it by pressing the cursor control knob. In the Choices selection box, select SYS_CONN .
6	Position the cursor at RUN TEST and select it. The software will provide operator prompts through completion of the connectivity setup.
7	Do the following when the test is complete, • position cursor on STOP TEST and select it • OR press the [K5] pushbutton.
8	To return to the main menu, press the [K5] pushbutton.
9	Press the [PRESET] pushbutton.

Pretest Setup for HP 8921A

Before the HP 8921A CDMA analyzer is used for LMF-controlled testing it must be set up correctly for automatic testing.

Table F-13: Pretest Setup for HP 8921A

Step	Action
1	Unplug the memory card if it is plugged in.
2	Press the CURSOR CONTROL knob.
3	Position the cursor at IO CONFIG (under To Screen and More) and select it.
4	Select Mode and set for Talk&Lstn .

Pretest Setup for Agilent 8935

Before the Agilent 8935 analyzer is used for LMF controlled testing it must be set up correctly for automatic testing.

Table F-14: Pretest Setup for Agilent 8935	
Step	Action
1	Unplug the memory card if it is plugged in.
2	Press the Shift button and then press the I/O Config button.
3	Press the Push to Select knob.
4	Position the cursor at IO CONFIG and select it.
5	Select Mode and set for Talk&Lstn .

Figure F-14 shows the connections when *using* an external 10 MHz Rubidium reference.

Figure F-14: Cable Connections for Test Set with 10 MHz Rubidium Reference

F

R3465 GPIB Clock Set-up

Table F-15 describes the steps to set the clock for the **Advantest R3465** equipment.

Table F-15: Advantest R3465 Clock Setup	
Step	Action
1	Observe the current date and time displayed in upper right of the CRT display.
2	If the date and time are incorrect, perform the following to change them:
2a	– Push the Date/Time CRT menu key.
2b	– Rotate the vernier knob to select and set.
2c	– Push the vernier knob to enter.
2d	– Push the SHIFT then PRESET pushbutton (just below the CRT display).

Pretest Setup for Advantest R3465

Before the Advantest R3465 analyzer is used for LMF-controlled testing it must be set up correctly for automatic testing.

Table F-16: Pretest Setup for Advantest R346

Step	Action
1	Press the SHIFT button so the LED next to it is illuminated.
2	Press the RESET button.

Agilent 8932/E4432B Test Equipment Interconnection

To perform FER testing on a 1X BTS with the Agilent 8935, a 1X-capable signal generator, such as the Agilent E4432B, must be used in conjunction with the CDMA base station test set. For proper operation, the test equipment items must be interconnected as follows:

10 MHz reference signal – Connect a BNC (M)–BNC (M) cable from the 8935 **10 MHz REF OUT** connector to the E4432B **10MHz IN** connector as shown in Figure F-15

Even second pulse reference – Refer to Figure F-15, and connect a BNC “T” connector to the 8935 **EVEN SEC SYNC IN** connector. Connect a BNC (M)–BNC (M) cable from one side of the BNC “T” to the E4432B **PATTERN TRIG IN** connector. Connect the other side of the BNC “T” to the CSM board **SYNC MONITOR** connector using a BNC (M)–BNC (M) cable.

Figure F-15: Agilent 8935/E4432B 10MHz Reference and Even Second Tick Connections

TDME0011-1

Agilent E4406A/E4432B Test Equipment Interconnection

To provide proper operation during testing when both units are required, the 10 MHz reference signal from the E4406A transmitter test set must be provided to the E4432B signal generator. Connect a BNC (M)–BNC (M) cable from the E4406A **10 MHz OUT (SWITCHED)** connector to the E4432B **10MHz IN** connector as shown in Figure F-16.

Figure F-16: Agilent 10 MHz Reference Connections

Advantest R3267/R3562 Test Equipment Interconnection

To provide proper operation during testing when both units are required, the R3257 spectrum analyzer must be interconnected with the R3562 signal generator as follows:

10 MHz reference signal – Connect a BNC (M)–BNC (M) cable between the R3562 **SYNTH REF IN** connector and the R3267 **10 MHz OUT** connector as shown in Figure F-17.

Serial I/O – Using the Advantest cable provided, connect the R3267 **SERIAL I/O** connector to the R3562 **SERIAL I/O** connector as shown in Figure F-17.

Figure F-17: Advantest 10 MHz Reference and Serial I/O Connections

TDME0010-1

Equipment Calibration

Calibration Without the LMF

Several test equipment items used in the optimization process require pre-calibration actions or calibration verification which are not supported by the LMF. Procedures to perform these activities for the applicable test equipment items are covered in this section.

Agilent E4406A Transmitter Tester Self-alignment (Calibration)

Refer to Figure F-18 and follow the procedure in Table F-17 to perform the Agilent E4406A self-alignment (calibration).

Table F-17: Perform Agilent E4406A Self-alignment (Calibration)	
Step	Action
1	In the SYSTEM section of the instrument front panel, press the System key. – The softkey labels displayed on the right side of the instrument screen will change.
2	Press the Alignments softkey button to the right of the instrument screen. – The softkey labels will change.
3	Press the Align All Now softkey button. – All other instrument functions will be suspended during the alignment. – The display will change to show progress and results of the alignments performed. – The alignment will take less than one minute.

Calibrating HP 437 Power Meter

Precise transmit output power calibration measurements are made using a bolometer–type broadband power meter with a sensitive power sensor. Follow the steps outlined in Table F-18 to enter information unique to the power sensor before calibrating the test setup. Refer to Figure F-19 as required.

NOTE

This procedure must be done *before* the automated calibration to enter power sensor specific calibration values.

Figure F-19: Power Meter Detail

Table F-18: HP 437 Power Meter Calibration Procedure

Step	Action
1	! CAUTION Do not connect/disconnect the power meter sensor cable with AC power applied to the meter. Disconnection could result in destruction of the sensing element or mis–calibration. Make sure the power meter AC LINE pushbutton is OFF .
2	Connect the power sensor cable to the SENSOR input.
3	Set the AC LINE pushbutton to ON . NOTE The calibration should be performed only after the power meter and sensor have been allowed to warm–up and stabilize for a <i>minimum of 60 minutes</i> .
4	Perform the following to set or verify the correct power sensor model:
4a	– Press [SHIFT] then [RIGHT ARROW] to select SENSOR .
4b	– Identify the power sensor model number from the sensor label.
4c	– Use the [UP] or [DOWN] button to select the appropriate model; then press [ENTER] .
5	Refer to the illustration for step 8, and perform the following to ensure the power reference output is OFF :
5a	– Observe the instrument display and determine if the triangular indicator over PWR REF is displayed.
5b	– If the triangular indicator is displayed, press [SHIFT] then [RIGHT ARROW] to turn it off.

... continued on next page

Table F-18: HP 437 Power Meter Calibration Procedure

Step	Action
6	Press [ZERO] . – Display will show “Zeroing *****.” – Wait for process to complete.
7	Connect the power sensor to the POWER REF output.
8	Turn on the PWR REF by performing the following:
8a	– Press [SHIFT] then [↵] .
8b	– Verify that the triangular indicator (below) appears in the display above PWR REF .
9	Perform the following to set the REF CF% :
9a	– Press ([SHIFT] then [ZERO]) for CAL .
9b	– Enter the sensor's REF CF% from the sensor's decal using the arrow keys and press [ENTER] . (The power meter will display “CAL *****” for a few seconds.) NOTE If the REF CAL FACTOR (REF CF) is not shown on the power sensor, assume it to be 100%.
10	Perform the following to set the CAL FAC % :
10a	– Press [SHIFT] then [FREQ] for CAL FAC .
10b	– On the sensor's decal, locate an approximate calibration percentage factor (CF%) at 2 GHz.
10c	– Enter the sensor's calibration % (CF%) using the arrow keys and press [ENTER] . — When complete, the power meter will typically display 0.05 dBm. (Any reading between 0.00 and 0.10 is normal.)
11	To turn off the PWR REF , perform the following:
11a	– Press [SHIFT] then [↵] .
11b	– Disconnect the power sensor from the POWER REF output.

Calibrating Gigatronics 8541C Power Meter

Precise transmit output power calibration measurements are made using a bolometer-type broadband power meter with a sensitive power sensor. Follow the steps in Table F-19 to enter information unique to the power sensor.

Table F-19: Calibrate Gigatronics 8541C Power Meter	
Step	Action
1	! CAUTION Do not connect/disconnect the power meter sensor cable with AC power applied to the meter. Disconnection could result in destruction of the sensing element or miscalibration. Make sure the power meter POWER pushbutton is OFF.
2	Connect the power sensor cable to the SENSOR input.
3	Set the POWER pushbutton to ON. NOTE Allow the power meter and sensor to warm up and stabilize for a <i>minimum of 60 minutes</i> before performing the calibration procedure.
4	Connect the power sensor to the CALIBRATOR output connector.
5	Press ZERO. – Wait for the process to complete. Sensor factory calibration data is read to power meter during this process.
6	When the zeroing process is complete, disconnect the power sensor from the CALIBRATOR output.

Figure F-20: Gigatronics 8541C Power Meter Detail

Manual Cable Calibration

Calibrating Test Cable Setup Using HP PCS Interface (HP83236)

Table F-20 covers the procedure to calibrate the test equipment using the HP8921 Cellular Communications Analyzer equipped with the HP83236 PCS Interface.

NOTE	This calibration method <i>must be executed with great care.</i> Some losses are measured close to the minimum limit of the power meter sensor (–30 dBm).
-------------	--

Prerequisites

Ensure the following prerequisites have been met before proceeding:

- Test equipment to be calibrated has been connected correctly for cable calibration.
- Test equipment has been selected and calibrated.

Table F-20: Calibrating Test Cable Setup (using the HP PCS Interface)

Step	Action
	NOTE Verify that GPIB controller is turned off.
1	Insert HP83236 Manual Control System card into memory card slot.
2	Press the Preset pushbutton.
3	Under Screen Controls , press the TESTS pushbutton to display the TESTS (Main Menu) screen.
4	Position the cursor at Select Procedure Location and select it. In the Choices selection box, select CARD .
5	Position the cursor at Select Procedure Filename and select it. In the Choices selection box, select MANUAL .
6	Position the cursor at RUN TEST and select it. HP must be in Control Mode Select YES .
7	If using HP83236A: Set channel number=<chan#>: – Position cursor at Channel Number and select it. – Enter the <i>chan#</i> using the numeric keypad; press [Enter] and the screen will go blank. – When the screen reappears, the <i>chan#</i> will be displayed on the channel number line. If using HP83236B: Set channel frequency: – Position cursor at Frequency Band and press Enter. – Select User Defined Frequency. – Go Back to Previous Menu. – Position the cursor to 83236 generator frequency and enter actual RX frequency. – Position the cursor to 83236 analyzer frequency and enter actual TX frequency.
8	Set RF Generator level: – Position the cursor at RF Generator Level and select it. – Enter –10 using the numeric keypad; press [Enter] and the screen will go blank. – When the screen reappears, the value –10 dBm will be displayed on the RF Generator Level line.

... continued on next page

F

Table F-20: Calibrating Test Cable Setup (using the HP PCS Interface)

Step	Action
9	Set the user fixed Attenuation Setting to 0 dBm : – Position cursor at Analyzer Attenuation and select it – Position cursor at User Fixed Atten Settings and select it. – Enter 0 (zero) using the numeric keypad and press [Enter].
10	Select Back to Previous Menu .
11	Record the HP83236 Generator Frequency Level: Record the HP83236B Generator Frequency Level: – Position cursor at Show Frequency and Level Details and select it. – Under HP83236 Frequencies and Levels, record the Generator Level. – Under HP83236B Frequencies and Levels, record the Generator Frequency Level (1850 – 1910 MHz). – Position cursor at Prev Menu and select it.
12	Click on Pause for Manual Measurement .
13	Connect the power sensor directly to the <i>RF OUT ONLY</i> port of the PCS Interface.
14	On the HP8921A, under To Screen , select CDMA GEN .
15	Move the cursor to the Amplitude field and click on the Amplitude value.
16	Increase the Amplitude value until the power meter reads 0 dBm ±0.2 dB . NOTE The Amplitude value can be increased coarsely until 0 dBm is reached; then fine tune the amplitude by adjusting the Increment Set to 0.1 dBm and targeting in on 0 dBm.
17	Disconnect the power sensor from the <i>RF OUT ONLY</i> port of the PCS Interface. NOTE The Power Meter sensor's lower limit is –30 dBm. Thus, only components having losses ≤30 dB should be measured using this method. For further accuracy, always re-zero the power meter before connecting the power sensor to the component being calibrated. After connecting the power sensor to the component, record the calibrated loss immediately.
18	Disconnect all components in the test setup and calibrate each one separately by connecting each component, one-at-a-time, between the <i>RF OUT ONLY PORT</i> and the power sensor. Record the calibrated loss value displayed on the power meter. • Example: (A) Test Cable(s) = –1.4 dB (B) 20 dB Attenuator = –20.1 dB (B) Directional Coupler = –29.8 dB
19	After all components are calibrated, reassemble all components together and calculate the total test setup loss by adding up all the individual losses: • Example: Total test setup loss = –1.4 –29.8 –20.1 = –51.3 dB. This calculated value will be used in the next series of tests.
20	Under Screen Controls press the TESTS button to display the TESTS (Main Menu) screen.
21	Select Continue (K2) .
22	Select RF Generator Level and set to –119 dBm.

... continued on next page

Table F-20: Calibrating Test Cable Setup (using the HP PCS Interface)

Step	Action
23	Click on Pause for Manual Measurement .
24	Verify the HP8921A Communication Analyzer/83203A CDMA interface setup is as follows (fields not indicated remain at default): • Verify the GPIB (HP-IB) address: – under To Screen, select More – select IO CONFIG – Set HP-IB Adrs to 18 – set Mode to Talk&Lstn • Verify the HP8921A is displaying frequency (instead of RF channel) – Press the blue [SHIFT] button, then press the Screen Control [DUPLEX] button; this switches to the CONFIG (CONFIGURE) screen. – Use the cursor control to set RF Display to Freq
25	Refer to Chapter 3 for assistance in setting the cable loss values into the LMF.

Figure F-21: Cable Calibration Using HP8921 with PCS Interface

Calibrating Test Cable Setup Using Advantest R3465

NOTE	Be sure the GPIB Interface is OFF for this procedure.
-------------	---

Advantest R3465 Manual Test setup and calibration must be performed at both the TX and RX frequencies.

Table F-21: Procedure for Calibrating Test Cable Setup Using Advantest R3465

Step	Action
	* IMPORTANT – This procedure can only be performed <i>after</i> test equipment has been allowed to warm-up and stabilize for a <i>minimum of 60 minutes</i> .
1	Press the SHIFT and the PRESET keys located below the display
2	Press the ADVANCE key in the MEASUREMENT area of the control panel.
3	Select the CDMA Sig CRT menu key
4	Select the Setup CRT menu key
5	Using the vernier knob and the cursor keys set the following parameters NOTE Fields not listed remain at default Generator Mode: SIGNAL Link: FORWARD Level Unit: dBm CalCorrection: ON Level Offset: OFF
6	Select the return CRT menu key
7	Press FREQ key in the ENTRY area
8	Set the frequency to the desired value using the keypad entry keys
9	Verify that the Mod CRT menu key is highlighting OFF; if not, press the Mod key to toggle it OFF.
10	Verify that the Output CRT menu key is highlighting OFF; if not, press the Output key to toggle it OFF.
11	Press the LEVEL key in the ENTRY area.
12	Set the LEVEL to 0 dBm using the key pad entry keys.
13	Zero power meter. Next connect the power sensor directly to the “RF OUT” port on the R3561L CDMA Test Source Unit.
14	Press the Output CRT menu key to toggle Output to ON.
15	Record the power meter reading _____

... continued on next page

F

Table F-21: Procedure for Calibrating Test Cable Setup Using Advantest R3465

Step	Action								
16	Disconnect the power meter sensor from the R3561L RF OUT jack. * IMPORTANT The Power Meter sensor's lower limit is –30 dBm. Thus, only components having losses ≤ 30 dB should be measured using this method. For best accuracy, always re-zero the power meter before connecting the power sensor to the component being calibrated. Then, after connecting the power sensor to the component, record the calibrated loss immediately.								
17	Disconnect all components in the the test setup and calibrate each one separately. Connect each component one-at-a-time between the “RF OUT” port and the power sensor (see Figure F-22, “Setups A, B, and C”). Record the calibrated loss value displayed on the power meter for each connection. Example: <table> <tr> <td>(A) 1st Test Cable</td> <td>= –0.5 dB</td> </tr> <tr> <td>(B) 2nd Test Cable</td> <td>= –1.4 dB</td> </tr> <tr> <td>(C) 20 dB Attenuator</td> <td>= –20.1 dB</td> </tr> <tr> <td>(D) 30 dB Directional Coupler</td> <td>= –29.8 dB</td> </tr> </table>	(A) 1st Test Cable	= –0.5 dB	(B) 2nd Test Cable	= –1.4 dB	(C) 20 dB Attenuator	= –20.1 dB	(D) 30 dB Directional Coupler	= –29.8 dB
(A) 1st Test Cable	= –0.5 dB								
(B) 2nd Test Cable	= –1.4 dB								
(C) 20 dB Attenuator	= –20.1 dB								
(D) 30 dB Directional Coupler	= –29.8 dB								
18	Press the Output CRT menu key to toggle Output OFF.								
19	Calculate the total test setup loss by adding up all the individual losses: Example: Total test setup loss = $0.5 + 1.4 + 20.1 + 29.8 = 51.8$ dB This calculated value will be used in the next series of tests.								
20	Press the FREQ key in the ENTRY area								
21	Using the keypad entry keys, set the test frequency to the RX frequency								
22	Repeat steps 9 through 19 for the RX frequency.								
23	Refer to Chapter 3 for assistance in setting the cable loss values into the LMF.								

Figure F-22: Cable Calibration Using Advantest R3465

This image shows a single sheet of white paper with horizontal ruling lines. The lines are evenly spaced and run across the width of the page. There are no margins, text, or other markings on the paper.

Appendix G

Download ROM Code

Download ROM Code

Exception Procedure – Downloading ROM Code

This procedure is not part of a normal optimization.

Perform this procedure only on an exception basis when no alternative exists to load a BTS device with the correct version of ROM code.

NOTE	One GLI must be INS_ACT (bright green) before ROM code can be downloaded to non-GLI devices.
-------------	--

CAUTION	The correct ROM and RAM codes for the software release used on the BSS must be loaded into BTS devices. To identify the correct device ROM and RAM code loads for the software release being used on the BSS, refer to the Version Matrix section of the SC™ CDMA Release Notes (supplied on the tapes or CD-ROMs containing the BSS software). All devices in a BTS must be loaded with the ROM and RAM code specified for the software release used on the BSS before any optimization or ATP procedures can be performed. If a replacement device is loaded with ROM code which is not compatible with the BSS software release being used, the device ROM code can be changed using the LMF before performing the BTS optimization and ATPs. <i>A device loaded with later release ROM code can not be converted back to a previous release ROM code in the field without Motorola assistance</i>
----------------	--

If it is necessary to download ROM code to a device from the LMF, the procedure in Table G-1 includes steps *for both ROM and RAM code download using the LMF*.

Prerequisites

Prior to performing this procedure, ensure the correct ROM and RAM code files exist in the LMF computer's applicable `<x>:\lmf home directory>\cdma\loads\<code load#>\code` folder for each of the devices to be loaded (refer to NO TAG).

CAUTION	The Release level of the ROM code to be downloaded must be the one specified for the software release installed in the BSS. The release level of the ROM code resident in the other devices in the BTS must also be correct for the BSS software release being used. ROM code must not be downloaded to a frame loaded with code for a BSS software release with which it is not compatible. <i>This procedure should only be used to upgrade replacement devices for a BTS. It should NOT be used to upgrade all devices in a BTS. If a BTS is to be upgraded from R15.x to R16.0, the upgrade should be done by the OMC-R using the DownLoad Manager.</i>
----------------	---

Table G-1: Download ROM and RAM Code to Devices

Step	Action
1	Click on the device to be loaded. NOTE More than one device of the <i>same</i> type can be selected for download by either clicking on each one to be downloaded or from the BTS menu bar Select pull-down menu, select the <i>device</i> item that applies. Where: <i>device</i> = the type of device to be loaded (BBX, CSM, GLI, MCC)
2	From the BTS menu bar Device pull-down menu, select Status . – A status report window will appear.
3	Make a note of the number in the HW Bin Type column. NOTE “HW Bin Type” is the Hardware Binary Type for the device. This code is used as the last four digits in the filename of a device’s binary ROM code file. Using this part of the filename, the ROM code file can be matched to the device in which it is to be loaded.
4	Click OK to close the status window.
5	Click on the device to be loaded.
6	NOTE ROM code is automatically selected for download from the <x>:\<lmf home directory>\<version folder>\<code folder> specified by the NextLoad property in the bts-#.cdf file. To check the value of the NextLoad property, click on Util > Examine > Display Nextload . A pop-up message will show the value of the NextLoad. From the BTS menu bar Device pull-down menus, select Download > ROM . – If the file matching the Hardware Binary Type of the device is found in the code folder, a status report shows the result of the download. Proceed to Step 11. – If a file selection window appears, select the ROM code file manually.
7	Double-click on the version folder with the desired version number for the ROM code file (for example 2.16.0.x).
8	Double-click the Code folder. – A list of ROM and RAM code files will be displayed.
9	! CAUTION A ROM code file with the correct HW Bin Type must be chosen. Using a file with the wrong HW Bin Type can result in unpredictable operation and damage to the device. Click on the ROM code file with the filename which matches the device type and HW Bin Type number noted in step 3 (for example, file bbx_rom.bin.0604 is the ROM code file for a BBX with a HW Bin Type of 0604). – The file should be highlighted.
10	Click on the Load button. – A status report window is displayed showing the result of the download. NOTE If the ROM load failed for some devices, load them <i>individually</i> by clicking on one device, perform steps 6 through 10 for it, and repeat the process for each remaining device.
11	Click OK to close the status window.

... continued on next page

Table G-1: Download ROM and RAM Code to Devices

Step	Action
12	From the LMF window menu bar Tools pull–down menus, select Update NextLoad > CDMA .
13	In the left–hand pane of the window which opens, click on the BTS number for the frame being loaded (for example, <i>BTS–14</i>).
14	On the list of versions displayed in the right–hand pane, click the button next to the version number of the folder that was used for the ROM code download (for example, <i>2.16.0.x</i>) and click Save . – A pop–up message will appear showing the CDF has been updated.
15	Click on the OK button to dismiss the pop–up message.
16	Click on the device that was loaded with ROM code.
17	NOTE RAM code is automatically selected for download. From the BTS menu bar Device pull–down menus, select Download > Code/Data to download RAM code and dds file data. – A status report is displayed showing the result of the download.
18	Click OK to close the status window.
19	Observe the downloaded non–GLI device to ensure it is OOS_RAM (yellow).
20	Click on the device which was loaded with code.
21	From the BTS menu bar Device pull–down menu, select Status . Verify that the correct ROM and RAM version numbers are displayed in the status report window.
22	Click OK to close the status window.

Appendix H

In-service Calibration

Introduction

Purpose

This procedure is a guide to performing calibration of new BTS expansion carriers while the system remains in service. This procedure also supports BTS recalibration following replacement of RF chain components while the remainder of the site stays in service.

Motorola recommends performing this procedure during a maintenance window.

This procedure cannot be performed on BTSs with 2-to-1 combiners. The procedure can only be performed on one carrier of the BTS at a time. That is, LPAs 1A, 1B, 1C, and 1D can be calibrated while LPAs 3A, 3B, 3C, and 3D remain in service and vice versa.

Equipment Stabilization and Calibration

NOTE	Calibration of the communications test set (or equivalent test equipment) must be performed at the site before calibrating the overall <i>test equipment set</i> . Calibrate the test equipment <i>after</i> it has been allowed to warm-up and stabilize for a <i>minimum of 60 minutes</i> .
-------------	---

CAUTION	If any component of the <i>test equipment set</i> (for example, a test cable, RF adapter, signal generator) has been replaced, the <i>test equipment set</i> must be recalibrated. Failure to do so could introduce measurement errors which ultimately result in degradation of system performance.
----------------	--

1X Test Equipment Requirements

In-Service Calibration (ISC) of 1X carrier functions requires using the following test equipment for the purposes indicated:

- An Advantest R3267 spectrum analyzer to perform TX calibration
- An Advantest R3562 signal generator for R3267 Delta Power Calibration
- An Agilent E4406A Transmitter Test Set to perform TX calibration
- An Agilent E4432A signal generator for E4406A Delta Power Calibration
- An Agilent 8935 series E6380A equipped with option 200 (if purchased new) or option R2K (if retrofitted) to perform TX calibration

The CDMA communications system analyzers listed above are capable of calibrating the BTS for both IS-95 A and B mode operation as well as CDMA2000 1X operation.

NOTE	IS-95A/B communication test sets such as the HP8921A/600 and Advantest R3561L <i>can not calibrate 1X carrier functions</i> .
-------------	---

Calibration and test set-up for the HP 8921A/600 and Advantest R3561L test sets is included only for situations where it is necessary to use them for calibration of IS-95A/B mode operation.

Power Delta Calibration

Introduction

The ISC procedure has several differences from a normal calibration procedure. One of these is the use of a spectrum analyzer/communications test set instead of a power meter to measure power. Power meters are broadband measurement devices and cannot be used to measure power during ISC because other carriers are operating. A spectrum analyzer can be used because it measures power at a given frequency. Measuring power using a spectrum analyzer is less accurate than using a power meter, therefore, compensation is required for the accuracy difference (delta) between the power meter and the spectrum analyzer.

Agilent E4406A Power Delta Calibration

The Agilent E4406A transmitter tester and E4432B signal generator test equipment combination can be used for ISC of IS-2000 CDMA 1X as well as IS-95A/B operation modes. The power delta calibration is performed on the E4406A, but the E4432B is required to generate the reference signal used to calculate the power delta offset. After the offset value has been calculated, add it to the TX cable loss value in the LMF.

Preliminary Agilent Test Equipment Set-up

To provide proper operation during power delta calibration, be sure the E4406A and E4432B are connected as shown in Figure F-16.

Power Delta Calibration

Follow the procedure in Table H-1 to perform the Agilent E4406A Power Delta Calibration procedure.

Table H-1: Agilent E4406A Power Delta Calibration Procedure	
Step	Action
	NOTE Perform this procedure <i>after</i> test equipment has been allowed to warm-up and stabilize for a <i>minimum of 60 minutes</i> . After it is warmed up and stabilized, calibrate the test equipment as described in the “Test Set Calibration” section of Chapter NO TAG.
1	Zero the Power Meter prior to connecting the power sensor to the RF cable from the signal generator. NOTE For best accuracy, always re-zero the power meter before connecting the power sensor to the component being calibrated.
2	Be sure the E4406A and E4432B are connected as shown in Figure F-16.
3	Connect a short RF cable from the E4432B RF OUTPUT connector the HP437 power meter power sensor (see Figure H-1).

. . . continued on next page

Table H-1: Agilent E4406A Power Delta Calibration Procedure

Step	Action
4	Set the E4432B signal generator as follows: – Press Preset to exit any modes for which the signal generator is configured – Press Frequency and enter the <i>frequency</i> of the channel to be calibrated on the numeric keypad – Using the soft keys to the right of the screen, select the frequency range to be measured; for example MHz – Press Amplitude and, using the numeric keypad, set signal amplitude to 0 (zero) – Using the soft keys, set the measurement type to dBm
5	On the E4432B, press RF On/Off to toggle the RF output to RF ON . – Note that the RF On/Off status in the screen display changes.
6	Measure and record the value reading on the HP437 power meter as result A _____.
7	On the E4432B, press RF On/Off to toggle the RF output to RF OFF . – Note that the RF On/Off status in the screen display changes.
8	Disconnect the short RF cable from the HP437 power meter power sensor, and connect it to the RF INPUT connector on the E4406A transmitter tester (see Figure H-2).
9	NOTE Do not change the frequency and amplitude settings on the E4432B when performing the following steps. Set the E4406A as follows: – Press Preset to exit any modes for which the transmitter tester is configured – Press MODE and, using the soft keys to the right of the screen, select cdmaOne – Press MEASURE and, using the soft keys, select spectrum – Press Frequency and, using the soft keys, select Center Frequency – Enter the <i>frequency</i> of the channel to be calibrated using the numeric keypad – Using the soft keys, select the frequency range to be measured; for example, MHz – Press Input/Output and, using the soft keys, select Input Atten – Using the numeric keypad, set Input Atten to 0 (zero) and, using the soft keys, select dB – Using the soft keys, select External Atten and then select Mobile – Using the numeric keypad, set Mobile to 0 (zero) and, using the soft keys, select dB – Using the soft keys, select Base – Using the numeric keypad, set Base to 0 (zero) and, using the soft keys, select dB – Press MEASURE and, using the soft keys, select Channel Power
10	On the E4432B signal generator, press RF On/Off to toggle the RF output to RF ON . – Note that the RF On/Off status in the screen display changes.
11	Read the measured Channel Power from the E4406A screen display and record it as result B _____.
12	On the E4432B, press RF On/Off to toggle the RF output to RF OFF . – Note that the RF On/Off status in the screen display changes.

... continued on next page

Table H-1: Agilent E4406A Power Delta Calibration Procedure	
Step	Action
13	Calculate the Power Calibration Delta value. The delta value is the power meter measurement minus the Agilent measurement. Delta = A – B Example: Delta = –0.70 dBm – (–1.25 dBm) = 0.55 dBm Example: Delta = 0.26 dBm – 0.55 dBm = –0.29 dBm These examples are included to show the mathematics and do not represent actual readings. NOTE Add this delta value to the TX Cable Loss value during In-Service Calibration (see step 4 in Table H-6).

H

Advantest R3267 Power Delta Calibration

The Advantest R3267 spectrum analyzer and R3562 signal generator test equipment combination can be used for ISC of IS-2000 CDMA 1X as well as IS-95A/B operation modes. The power delta calibration is performed on the R3267. After the offset value has been calculated, add it to the TX cable loss value.

Preliminary Advantest Test Equipment Set-up

To provide proper operation during power delta calibration, be sure the R3267 is connected to the R3562 as shown in Figure F-17.

Power Delta Calibration

Follow the procedure in Table H-2 to perform the Advantest R3267 Power Delta Calibration procedure.

Table H-2: Advantest R3267 Power Delta Calibration Procedure

Step	Action
1	NOTE Warm-up <i>test equipment for a minimum of 60 minutes</i> prior to this procedure. After it is warmed up and stabilized, calibrate the test equipment as described in the “Test Set Calibration” section of Chapter NO TAG. Be sure the R3267 and R3562 are connected as shown in Figure F-17.
2	Press the SHIFT and the PRESET keys located on the right side of the control panel.
3	Press the ADVANCE key in the MEASUREMENT area of the control panel.
4	On the CRT, select RX Control by pressing ACTIVE key 1.
5	On the CRT, select Frequency Setup by pressing ACTIVE key 3.
6	On the CRT, highlight Frequency by adjusting the DISPLAY CONTROL knob.
7	Press FREQ key in the ENTRY section of the control panel.
8	Set the frequency to the desired value using the keypad ENTRY section keys.
9	Press the LEVEL key in the ENTRY section of the control panel.
10	Set the level to 0 dBm using the keypad ENTRY section keys.
11	On the CRT, verify OFF is highlighted in Modulation , if not press the ACTIVE key 5 to toggle it OFF.
12	On the CRT, verify OFF is highlighted in Output , if not press the ACTIVE key 6 to toggle it OFF.
13	Zero the Power Meter prior to connecting the power sensor to the RF cable from the signal generator. NOTE For best accuracy, always re-zero the power meter before connecting the power sensor to the component being calibrated.
14	Connect the RF cable from the R3562 signal generator RF OUT port to the power sensor, refer to Figure H-4.
15	On the R3562 CRT, set the Output to ON by pressing ACTIVE key 6.

... continued on next page

Table H-2: Advantest R3267 Power Delta Calibration Procedure

Step	Action
16	Record the Power Meter reading as result A _____
17	On the R3562 CRT, set the Output to OFF by pressing ACTIVE key 6.
18	Connect the RF cable from R3562 signal generator RF OUT port to the R3267 spectrum analyzer INPUT Port, refer to Figure H-5.
19	On the R3562 CRT, set the Output to ON by pressing ACTIVE key 6.
20	On the R3267, press the POWER key in the MEASUREMENT section of the control panel.
21	Press the LEVEL key in the ENTRY section of the control panel.
22	Set the REF LEVEL to 10 dBm using the keypad ENTRY section keys.
23	On the CRT, select dB/div by pressing ACTIVE key 1.
24	On the CRT, select 10 dB/div by pressing ACTIVE key 1.
25	Press the FREQ key in ENTRY section of the control panel.
26	Set the frequency to the desired value using the keypad ENTRY section keys.
27	On the CRT, select more 1/2 by pressing ACTIVE key 7.
28	Press the Preselector CRT menu key to highlight 3.66G .
29	Press the POWER key in the MEASUREMENT section of the control panel.
30	Press the SPAN key in the ENTRY section of the control panel.
31	On the CRT, select Zero Span by pressing ACTIVE key 2.
32	Press the COUPLE key in the ENTRY section of the control panel.
33	On the CRT, select RBW and highlight MNL by pressing ACTIVE key 3.
34	Set RBW to 30 kHz using keypad ENTRY section keys.
35	On the CRT, select VBW and highlight MNL by pressing ACTIVE key 2.
36	Set VBW to 1 MHz using keypad ENTRY section keys.
37	Press the MKR key in the DISPLAY CONTROL section of the control panel.
38	On the CRT, select Normal Marker by pressing ACTIVE key 1.
39	Record the Marker Level reading as result B _____
40	Press Single in ENTRY section of control panel.

Table H-2: Advantest R3267 Power Delta Calibration Procedure	
Step	Action
41	Calculate the Power Calibration Delta value. The delta value is the power meter measurement minus the Advantest measurement. Delta = A – B Example: Delta = –0.7 dBm – (–1.25 dBm) = 0.55 dB Example: Delta = 0.26 dBm – 0.55 dBm = –0.29 dBm These examples are included to show the mathematics and do not represent actual readings. NOTE Add this delta value to the TX Cable Loss value during In–Service Calibration (see step 4 in Table H-6).

Figure H-3: Delta Calibration Setup – Advantest R3562 to HP437

Figure H-5: Delta Calibration Setup – Advantest R3562 to R3267

Agilent 8935 series E6380A Power Delta Calibration

The Agilent 8935 (formerly HP 8935) communications test set modified with either option 200 or R2K and E4432B signal generator test equipment combination can be used for ISC of IS–2000 CDMA 1X as well as IS–95A/B operation modes. The power delta calibration is performed on the Agilent 8935. After the offset value has been calculated, add it to the TX cable loss value.

Follow the procedure in Table H-3 to perform the Agilent 8935 Power Delta Calibration procedure.

Table H-3: Agilent 8935 Power Delta Calibration Procedure

Step	Action
	NOTE Perform this procedure <i>after</i> test equipment has been allowed to warm-up and stabilize for a <i>minimum of 60 minutes</i> . After it is warmed up and stabilized, calibrate the test equipment as described in the “Test Set Calibration” section of Chapter NO TAG.
1	Zero the Power Meter prior to connecting the power sensor to the RF cable from the signal generator. NOTE For best accuracy, always re-zero the power meter before connecting the power sensor to the component being calibrated.
2	Connect a short RF cable between the Agilent 8935 Duplex Out port and the HP437 power sensor (see Figure H-6).
3	Set the Agilent 8935 signal source as follows: – Measure mode to CDMA Gen – Frequency to the CDMA Calibration target frequency – CW RF Path to IQ – Output Port to Dupl – Data Source to Random – Amplitude to 0 dBm
4	Measure and record the power value reading on the HP437 Power Meter.
5	Record the Power Meter reading as result A _____.
6	Turn off the Agilent 8935 signal source output, and disconnect the HP437. NOTE Leave the settings on the source Agilent 8935 for convenience in the following steps.
7	Connect the short RF cable between the Agilent 8935 Duplex Out port and the RF-IN/OUT port (see Figure H-7).
8	Ensure that the source Agilent 8935 settings are the same as in Step 3.

Figure H-7: Delta Calibration Setup – Agilent 8935 to Agilent 8935

H

HP8921A Power Delta Calibration

Use the HP8921A communications test set to measure power during ISC *only for IS-95A and B operation* of 800 MHz systems. After the offset value has been calculated, add it to the TX cable loss value.

Follow the procedure in Table H-4 to perform the HP8921A Power Delta Calibration procedure.

NOTE	This procedure requires two HP8921A communication test sets.
-------------	--

Table H-4: HP8921A Power Delta Calibration Procedure

Step	Action
	NOTE Perform this procedure <i>after</i> test equipment has been allowed to warm-up and stabilize for a <i>minimum of 60 minutes</i> . After it is warmed up and stabilized, calibrate the test equipment as described in the “Test Set Calibration” section of Chapter NO TAG.
1	Zero the Power Meter prior to connecting the power sensor to the RF cable from the signal generator. NOTE For best accuracy, always re-zero the power meter before connecting the power sensor to the component being calibrated.
2	Connect a short RF cable between the HP8921A Duplex Out port and the HP437 power sensor (see Figure H-8).
3	Set the HP8921A signal source as follows: – Measure mode to CDMA Generator – Frequency to the CDMA Calibration target frequency – CW RF Path to IQ – Output Port to Dupl – Data Source to Random – Amplitude to 0 dBm
4	Measure and record the power value reading on the HP437 Power Meter.
5	Record the Power Meter reading as result A _____.
6	Turn off the source HP8921A signal output, and disconnect the HP437. NOTE Leave the settings on the source HP8921A for convenience in the following steps.
7	Connect the short RF cable between the source HP8921A Duplex Out port and the measuring HP8921A RF-IN port (see Figure H-9).
8	Ensure that the source HP8921A settings are the same as in Step 3.

... continued on next page

Table H-4: HP8921A Power Delta Calibration Procedure	
Step	Action
9	Set the measuring HP8921A as follows: – Measure mode to CDMA AnI – Frequency to the CDMA calibration target frequency – Input Attenuation to 0 dB – Input port to RF-IN – Gain to Auto – Analyzer Direction to Fwd
10	Turn on the source HP8921A signal output.
11	Measure and record the channel power reading on the measuring HP8921A as result B _____.
12	Turn off the source HP8921A signal output and disconnect the equipment.
13	Compute the delta between HP437 and HP8921A using the following formula: Delta = A – B Example: Delta = –0.70 dBm – (–1.25 dBm) = 0.55 dBm Example: Delta = 0.26 dBm – 0.55 dBm = –0.29 dBm These examples are included to show the mathematics and do not represent actual readings. NOTE Add this delta value to the TX Cable Loss value during In–Service Calibration (see Step 4 in Table H-6).

Advantest R3465 Power Delta Calibration

Use the Advantest R3465 spectrum analyzer to measure power during *ISC only for IS-95A and B operation*. After the offset value has been calculated, add it to the TX cable loss value.

Follow the procedure in Table H-5 to perform the Advantest 3465 Power Delta Calibration procedure.

Table H-5: Advantest Power Delta Calibration Procedure

Step	Action
	NOTE Perform this procedure <i>after</i> test equipment has been allowed to warm-up and stabilize for a <i>minimum of 60 minutes</i> . After it is warmed up and stabilized, calibrate the test equipment as described in the “Test Set Calibration” section of Chapter NO TAG.
1	Press the SHIFT and the PRESET keys located below the CRT display.
2	Press the ADVANCE key in the Measurement area of the control panel.
3	Press the CDMA Sig CRT menu key.
4	Press the FREQ key in the Entry area of the control panel.
5	Set the frequency to the desired value using the keypad entry keys.
6	Press the LEVEL key in the Entry area of the control panel.
7	Set the LEVEL to 0 dBm using the keypad entry keys.
8	Verify the Mod CRT menu key is highlighting OFF , if not press the Mod key to toggle it OFF .
9	Verify the Output CRT menu key is highlighting OFF , if not press the Output key to toggle it OFF .
10	Zero the Power Meter prior to connecting the power sensor to the RF cable from the signal generator. NOTE For best accuracy, always re-zero the power meter before connecting the power sensor to the component being calibrated.
11	Connect the RF cable from the R3561L CDMA signal generator RF OUT port to the power sensor, refer to Figure H-10.
12	Press the Output CRT menu key to toggle the Output to ON .
13	Record the Power Meter reading as result A _____.
14	Press the Output CRT menu key to toggle the Output to OFF .
15	Connect the RF cable from the R3561L signal generator RF OUT port to the R3465 INPUT Port, refer to Figure H-11.
16	Press the Output CRT menu key to change the Output to ON .
17	Press the CW key in the Measurement area of the control panel.
18	Press the LEVEL key in the Entry area of the control panel.
19	Set the REF LEVEL to 10 dBm using the keypad entry keys.
20	Press the dB/div CRT menu key.
21	Press the 10 dB/div CRT menu key.

Figure H-11: Delta Calibration Setup – R3561L to R3465

In-Service Calibration

CAUTION

This feature does NOT have fault tolerance at this time. *The system has no safe-guards to prevent actions which will put the BTS out of service.* If possible, perform this procedure during a maintenance window.

Follow the procedures in this section precisely, otherwise the entire BTS will most likely go OUT OF SERVICE.

At the CBSC, only perform operations on expansion hardware when it is in the OOS_MANUAL state.

The operator must be trained in the LMF operation prior to performing this procedure.

Prerequisites

- Any applicable expansion hardware has been added in the CBSC database, and a CDF which includes the additions has been generated.
- Any expansion devices have been inserted into the SCCP cage and are in the OOS_MANUAL state at the CBSC MM.
- The site specific CDF (with any expansion hardware) and CAL files have been loaded onto the LMF.
- The LMF has the same device binary code and dds files as the CBSC.

CAUTION

Do not download code or data to any cards other than those being worked on. Downloading code or data to other cards will take the site OUT OF SERVICE.

The code file version numbers must match the current BSS software release version numbers required for the equipped devices (refer to NO TAG). If the numbers do not match, the site may go OUT OF SERVICE.

It is *mandatory* that the **bts-#.cdf** and **cbsc-#.cdf** files on the LMF computer for this BTS are copies of the corresponding files created in the CBSC database (see Table 3-2).

The CAL file loaded on the LMF computer for this BTS must have come from the CBSC.

- Test equipment has been connected as shown in Figure H-12 or Figure H-13.
- An RFDS (or as a minimum, a directional coupler), whose loss is already known, must be in the applicable TX antenna path to perform the in-service calibration.
- Test equipment has been calibrated after a 60-minute warm up.
- A short RF cable and two BNC-N adapters are available to perform Cable Calibration.
- N-SMA cable adapters are available to connect to TRDC or DRDC **BTS CPLD** connectors, and are included in cable loss measurements.

- The Power Delta Calibration has been performed (see Table H-1, Table H-2, Table H-3, Table H-4, or Table H-5).

Figure H-12: TX Calibration Test Setup – Agilent E4406A, Advantest R3267, and Agilent 8935 with Option 200 or R2K (IS-95A/B and 1X CDMA 2000)

Figure H-13: TX Calibration Test Setup – HP 8921A/600 w/PCS Interface (1.9 GHz), HP 8921A/600 (800 MHz), and Advantest R3465 (IS-95A/B only)

Follow the procedure in Table H-6 to perform the In-Service Calibration.

Table H-6: In-Service Calibration	
Step	Action
	NOTE Perform this procedure <i>after</i> test equipment has been allowed to warm-up and stabilize for a <i>minimum of 60 minutes</i>.
1	Set up the LMF for In-Service Calibration: – Start the LMF by double-clicking the LMF icon on the Windows desktop. – Click Tools > Options from the menu bar at the LMF application window. – In the LMF Options window, check only the applicable communications system analyzer check box on the Test Equipment tab. – Ensure that the GPIB address is 18. – Uncheck any other other equipment that is selected. – Click the Apply button. – Select the BTS Options tab in the LMF Options window. – Check the In-Service Calibration check box. – Click the Apply button. – Click the Dismiss button to close the LMF Option window.
2	Log into the target BTS: – Select the target BTS icon. – Click the Login button at the login screen.
3	Measure the Cable Loss using the Cable Calibration function: – Click Util > Cable Calibration... in the BTS menu bar at the main window. – Set the desired channel(s) and select TX and RX CABLE CAL from the Cable Calibration window drop-down list. – Click the OK button to perform cable calibration. – Follow the on-screen instructions to complete the cable loss measurement. NOTE – The measured value is input automatically to the cable loss file. – To view the cable loss file, click Util > Examine > Cable Loss from the BTS menu bar.
4	Add the communications system analyzer power delta to the TX Cable Loss. – In the BTS menu bar, click Util > Edit > Cable Loss... > TX. – Add the value computed in Table H-4, Table H-5, or Table H-3 to the TX Cable Loss. NOTE Be sure to include the sign of the value. The following examples are included to show the mathematics and do not represent actual readings: – Example: 5.65 dBm + 0.55 dBm = 6.20 dBm – Example: 5.65 dBm + (–0.29 dBm) = 5.36 dBm – Example: –5.65 dBm + 0.55 dBm = –5.10 dBm – Example: –5.65 dBm + (–0.29 dBm) = –5.94 dBm

Table H-6: In-Service Calibration

Step	Action
5	Input the Coupler Loss for the TX tests: – In the BTS menu bar, click Util > Edit > Coupler Loss... from the menu bar at the main window. – Select the TX Coupler Loss tab if not in the foreground. – Enter the appropriate coupler loss for the target carrier(s) by referring to the information taken at the time of BTS installation. – Click the Save button. – Click the Dismiss button to close the window. – To view the coupler loss file, click Util > Examine > Coupler Loss in the BTS menu bar.
6	Input the Coupler Loss for the RX tests: – In the BTS menu bar, click Util > Edit > Coupler Loss... from the menu bar at the main window. – Select the RX Coupler Loss tab if not in the foreground. – Enter the appropriate coupler loss for the target carrier(s) by referring to the information taken at the time of BTS installation. – Click the Save button. – Click the Dismiss button to close the window. – To view the coupler loss file, click Util > Examine > Coupler Loss in the BTS menu bar.
7	If it was not previously done, have the CBSC operator put the redundant BBX OOS_MANUAL.
	! CAUTION Be sure to download OOS devices only. Loading in-service devices takes them OUT OF SERVICE and can result in dropped calls. The code file version numbers must match the version numbers on the other cards in the frame. If the numbers do not match, the site may go OUT OF SERVICE. NOTE Be sure to include the redundant BBX in steps 8, 9, and 10.
8	Download code and data to the target devices: – In the LMF window menu bar, click Tools > Update NextLoad > CDMA to set the code version that will be downloaded. – Check the appropriate code version in the popup window and click the Save button to close. – Select the target BBX(s) on the SCCP cage picture. – In the BTS menu bar, click Device > Download > Code/Data to start downloading code and data.

... continued on next page

Table H-6: In-Service Calibration

Step	Action
9	! CAUTION Perform the All Cal/Audit procedure on OOS devices only. Run the All Cal/Audit procedure: – Select the target BBX(s) on the SCCP cage picture. – In the BTS menu bar, click Tests > All Cal/Audit... from the menu bar at the main window. – Select the target carrier and confirm the channel number in the pop up window. – Leave the Verify BLO check box checked. – Be sure the Test Pattern box shows Pilot. – Click the OK button to start calibration. – Follow the on-screen instructions, except, <i>do not connect to the BTS antenna port</i>. Connect to the DRDC or TRDC BTS CPL port associated with the on-screen prompted antenna port.
10	Save the result, and download the BLO data to the target BBX(s): – Click the Save Result button on the result screen. — The window closes automatically.
11	Logout from the BTS and close the LMF session: – In the BTS menu bar, click Select > Logout to close the BTS connection. – Close the LMF application program by selecting File > Exit from the window menu bar.
12	Disconnect all test cables from the BTS, and reconnect RFDS cables or termination loads, as applicable, to the DRDC or TRDC BTS CPL ports used for the calibration.
13	Advise the CBSC to enable the target device(s).
14	Restore the new “bts-*.cal” file to the CBSC (refer to Table 5-2).
