1. Statement of T-Coil Measurement

The lowest contiguous point count of primary group and secondary group found during test as bellows:

Air Interface	Primary Group Contiguous Point Count	Secondary Group Point Count	Frequency Response
GSM CMRS Voice	32	236	PASS
UMTS CMRS Voice	194	463	PASS
VoLTE	98	371	PASS
VoWiFi	86	330	PASS
OTT VoIP	96	323	PASS

Note:

1. This device is in compliance with compliance with T-Coil requirement specified in FCC 47 CFR Part 20.19 and tested in accordance with the measurement methods and procedures specified in ANSI C63.19-2019 and FCC KDB publications.
2. The test used the max power or the power of the device when held to the head for all users.
3. When the test result is a critical value, we will use the measurement uncertainty give the judgment result based on the 95% confidence intervals.

2. Technical Information

Note: Provide by applicant.

2.1. Applicant and Manufacturer Information

Applicant:	OnePlus Technology (Shenzhen) Co., Ltd.
Applicant Address:	18C02, 18C03, 18C04, and 18C05, Shum Yip Terra Building, Binhe Avenue North, Futian District, Shenzhen, Guangdong, P.R. China.
Manufacturer:	OnePlus Technology (Shenzhen) Co., Ltd.
Manufacturer Address:	18C02, 18C03, 18C04, and 18C05, Shum Yip Terra Building, Binhe Avenue North, Futian District, Shenzhen, Guangdong, P.R. China.

2.2. Equipment under Test (EUT) Description

Product Name:	Mobile Phone
EUT NO.:	59#, 60#
Hardware Version:	11
Software Version:	OxygenOS 15.0
Frequency Bands:	GSM 850: 824 MHz ~ 849 MHz GSM 1900: 1850 MHz ~ 1910 MHz WCDMA Band II: 1850 MHz ~ 1910 MHz WCDMA Band IV: 1710 MHz ~ 1755 MHz WCDMA Band V: 824 MHz ~ 849 MHz LTE Band 2: 1850 MHz ~ 1910 MHz LTE Band 4: 1710 MHz ~ 1755 MHz LTE Band 5: 824 MHz ~ 849 MHz LTE Band 7: 2500 MHz ~ 2570 MHz LTE Band 12: 699 MHz ~ 716 MHz LTE Band 13: 777 MHz ~ 787 MHz LTE Band 17: 704 MHz ~ 716 MHz LTE Band 18: 815 MHz ~ 830 MHz LTE Band 19: 830 MHz ~ 845 MHz LTE Band 25: 1850 MHz ~ 1915 MHz LTE Band 26: 814 MHz ~ 849 MHz LTE Band 30: 2305 MHz ~ 2315 MHz LTE Band 38: 2570 MHz ~ 2620 MHz LTE Band 41: 2496 MHz ~ 2690 MHz LTE Band 48: 3550 MHz ~ 3700 MHz LTE Band 66: 1710 MHz ~ 1780 MHz

Note:

1) Air Interface/Band MHz: List of all air interfaces and bands supported by the handset.
2) Type: For each air interface, indicate the type of voice transport mode:
   i. VO = legacy Cellular Voice Service, from ANSI C63.19-2019;
   ii. DT = Digital Transport only (no voice); and
   iii. VD = IP Voice Service over Digital Transport.
3) Simultaneous Transmitter: Indicate any air interface/bands that operate in simultaneous or concurrent service transmission mode**.**
4) Name of Voice Service: See Q4 in 285076 D03 HAC FAQ for further clarification.
5) Set device to highest transmit power in a held to the ear mode.

4. T-Coil Test Requirements and Restrictions

4.1. T-Coil Coupling Qualifying Field Strengths

In order to comply with the requirements for T-Coil use, a WD's tested operating modes shall simultaneously meet the requirements for minimum desired ABM signal level and maximum undesired ABM field contained in this sub clause at the minimum specified number of scanned locations.
When measured as specified in this standard, there are two groups of qualifying measurement points:

Primary group: A qualifying measurement point shall have its T-Coil signal, desired ABM signal, ≥−18 dB(A/m) at 1 kHz, in a 1/3 octave band filter. These measurements shall be made with the WD operating at a reference input level as specified in Table 6.1. Simultaneously, the qualifying measurement point shall have its weighted magnetic noise, undesired ABM field ≤ −38 dB (A/m).

Secondary group: A qualifying measurement point shall have its weighted magnetic noise, undesired ABM field ≤ −38 dB (A/m). This group inherently includes all the members of the primary group.

These levels are designed to be compatible with hearing aids that produce the same acoustic output level for either an acoustic input level of 65 dB SPL or a magnetic input level of −25 dB(A/m) (56.2 mA/m) at either 1.0 kHz or 1.6 kHz. The hearing aid operational measurements are performed per ANSI S3.22-2014.

4.2. Desired ABM signal and Undesired ABM Field Qualification Requirements

➢ **2G GSM Operating Modes**

If the 2G GSM operating mode(s) are selected for qualification, the qualifying measurement points shall fulfil the requirements of section 6.6.2 of ANSI C63.19; both the primary and secondary group requirements shall be met:

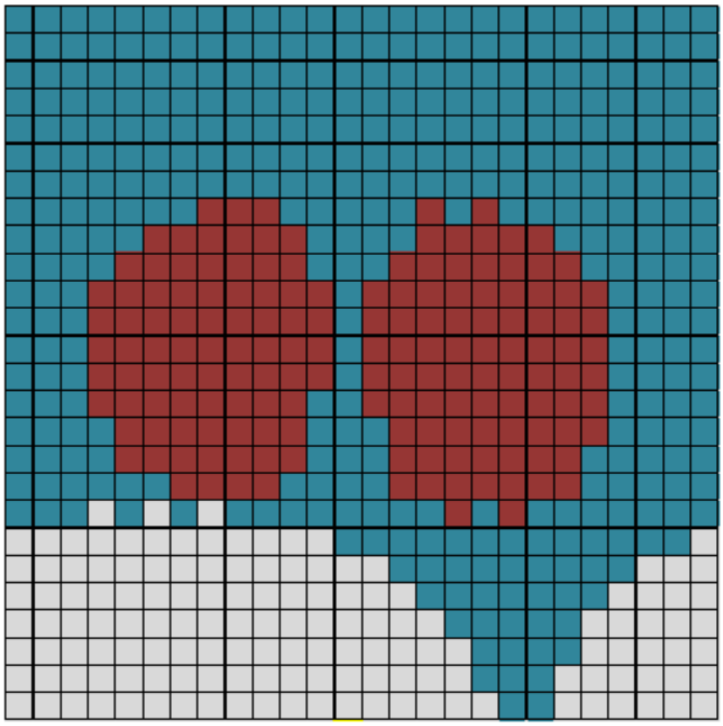
☐ The primary group shall include at least 25 measurement points.
☐ The secondary group shall include at least 125 contiguous measurement points.

➢ **Non-2G GSM Operating Modes**

The goal of this requirement is to ensure an adequate area where desired ABM signal is sufficiently strong to be heard clearly and a larger area where undesired ABM field is sufficiently low as to avoid undue annoyance. Qualifying measurement points shall fulfill the requirements of section 6.6.2 of ANSI C63.19; both the primary and secondary group requirements shall be met:

☐ The primary group shall include at least 75 measurement points.

☐ The secondary group shall include at least 300 contiguous measurement points.

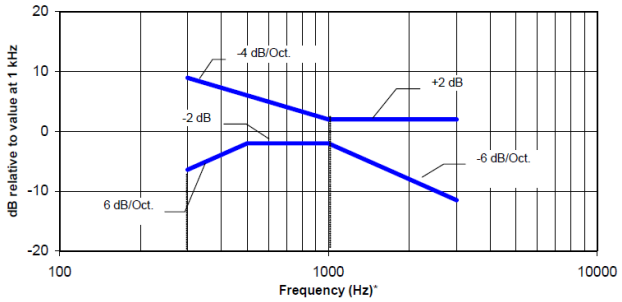


Red (primary group): AB desired ABM signal M1 ≥–18 dB(A/m) and undesired ABM field ≤–38 dB(A/m)
Blue and red (secondary group): undesired ABM field ≤–38 dB(A/m)

Fig 4.1 An example of a qualifying desired ABM signal, undesired ABM field scan

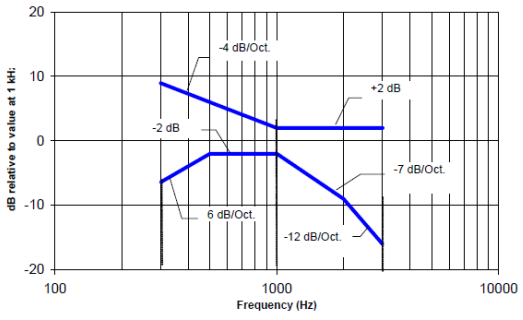
4.3. Frequency Response

The frequency response of the perpendicular component of the magnetic field, measured in 1/3 octave bands, shall follow the response curve specified in this sub-clause, over the frequency range 300 Hz to 3 kHz.



NOTE—The frequency response is between 300 Hz and 3000 Hz.

Fig 4.2 Magnetic field frequency response for WDs with field strength ≤ –15 dB (A/m) at 1 kHz



NOTE—The frequency response is between 300 Hz and 3000 Hz.

Fig 4.3 Magnetic field frequency response for WDs with a field that exceeds –15 dB (A/m) at 1 kHz

5. HAC (T-Coil) Measurement System

5.1. T-Coil Measurement Setup

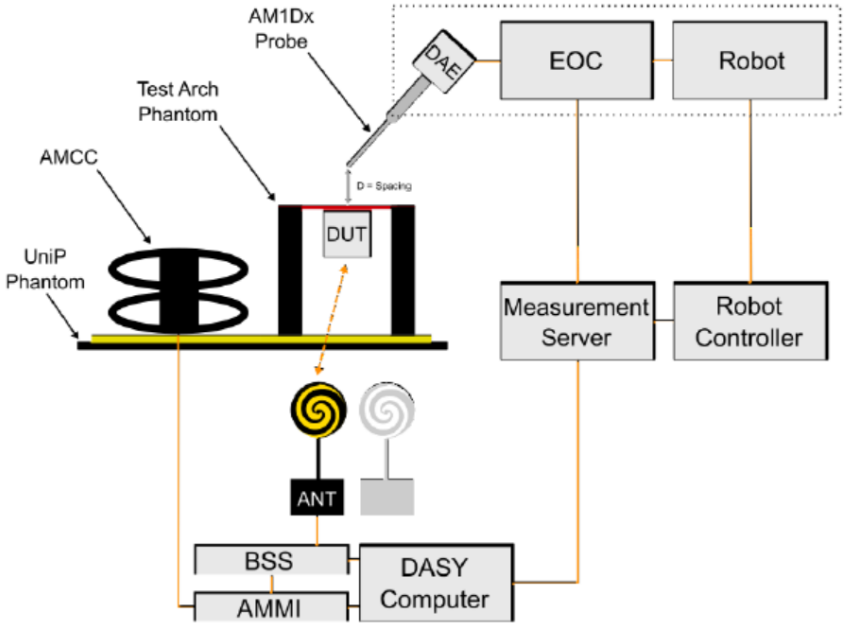


Fig 5.1 SPEAG T-Coil System Configurations

Note:

1. Per C63.19 & KDB 285076 D02, define the all of the applicable input audio level:

Standard	Protocol	Input Level (dBm0)
TIA-2000	CDMA	−18
TIA/EIA-136	TDMA (50 Hz)	−18
J-STD-007	GSM (217 Hz)	−16
T1/T1P1/3GPP (See Note 1)	UMTS (WCDMA)	−16
iDEN	TDMA (22 Hz and 11 Hz)	−18
VoIP (See Note 2)	Voice over Internet Protocol	−16

Note 1: For UMTS (Universal Mobile Telecommunications System), refer to 3GPP TS26.131 and TS26.132.

Note 2: VoIP is used in this table as a general term specifying a group of voice services that use −16 dBm0 as their normal acoustic level. The group includes a variety of voice services, including Voice-over-LTE (VoLTE), Voice-over-IP-multimedia-subsystem (VoIMS), Voice-over-Wi-Fi (VoWiFi) and similar services. For 3G, LTE, and WLAN terminals used for Commercial Mobile Radio Service (CMRS) based telephony, refer to 3GPP TS26.131 and TS26.132.

2. A communication base station CMU200 is used for testing GSM / UMTS / CDMA, and it's "Decode Cal" and "Codec Cal" with audio option B52 and B85 to set the correct audio input level.
3. CMU200 is able to output 1 kHz audio signal equivalent to 3.14dBm0 at "Decode Cal", the signal reference is used to adjust the AMMI gain setting to reach -16dBm0 for GSM/UMTS and -18dBm0 for CDMA.
4. The callbox of CMW500 is used for VoLTE over IMS and VoWiFi over IMS T-Coil measurement, the data application unit of the CMW500 was used to simulate the IP multimedia subsystem server. And the CMW500 can be manually configured to ensure and control the speech input level result is -16dBm0 for VoLTE and -20dBm0 for VoWiFi when the device during the IMS connection.
5. The OTT VoIP call is tested on the data application unit of CMW500 connection to the internet.

5.2. Base Station Gain Factor

1. The Required gain factor for the specific signal shall typically be multiplied by this factor to achieve approx. the same level as for the 1 kHz sine signal.
2. The calculation formula as below showing how to determine the input level for air interface for this device.

The predefined signal types have the following differences / factors compared to the 1kHz sine signal:

Signal [file name]	Duration [s]	Peak-to-RMS [dB]	RMS [dB]	Required gain factor *)	Gain setting
1kHz sine	---	3.0	0.0	1.00	
48k_1.025kHz_10s.wav	10	3.0	0.0	1.00	
48k_1kHz_3.15kHz_10s.wav	10	6.0	-3.0	1.42	
48k_315Hz_1kHz_10s.wav	10	6.0	-2.9	1.40	
48k_csek_8k_441_white_10s.wav	10	13.8	-10.5	3.34	
48k_multisine_50-5000_10s.wav	10	11.1	-7.9	2.49	
48k_voice_1kHz_1s.wav	1	16.2	-12.7	4.33	
48k_voice_300-3000_2s.wav	2	21.6	-18.6	8.48	

(*) The gain for the specific signal shall typically be multiplied by this factor to acheive approx. the same level as for the 1kHz sine signal.

Insert the gain applicable for your setup in the last column of the table.

<Input level determination>

Gain Value (linear)	Full Scaled Voltage (V)	dBm0	dB	AMMI Audio Out	AMCC Coil Out
-	1.5	3.14		0.5	3.14
100		5.6	40	2.96	-15.38
9.31		-16	19.38		-16

<Base station gain factor calculation>

Signal Type	Duration (s)	Peak to RMS (dB)	RMS (dB)	Gain Factor	Gain Setting
1kHz sine	-	3	0	1	8.17
48k_voice_1kHz	1	16.4	-12.8	4.35	40.32
48k_voice_300-3000	2	21.8	-18.7	8.51	78.96

5.3. T-Coil Measurement Reference Plane

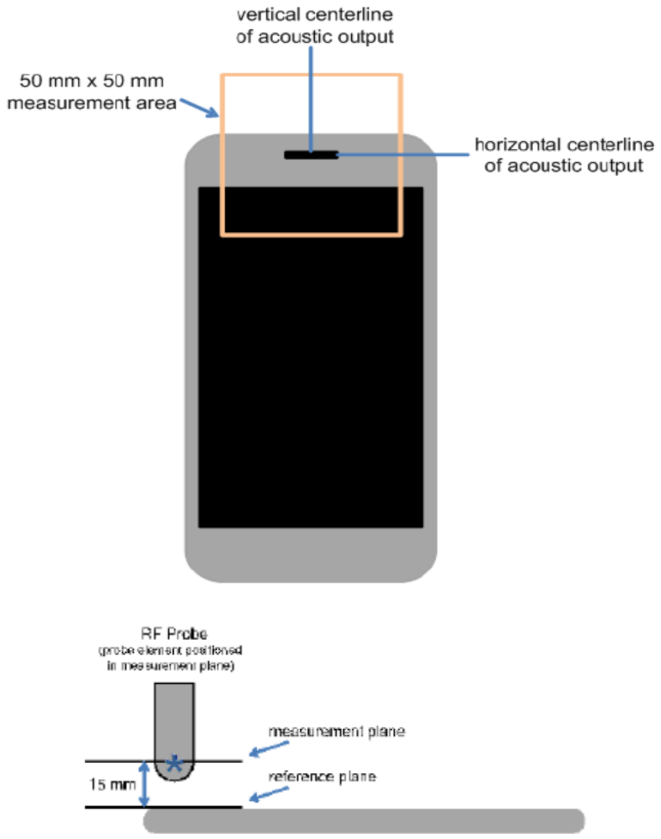

Fig 5.2 WD measurement and reference planes for RF emission measurements

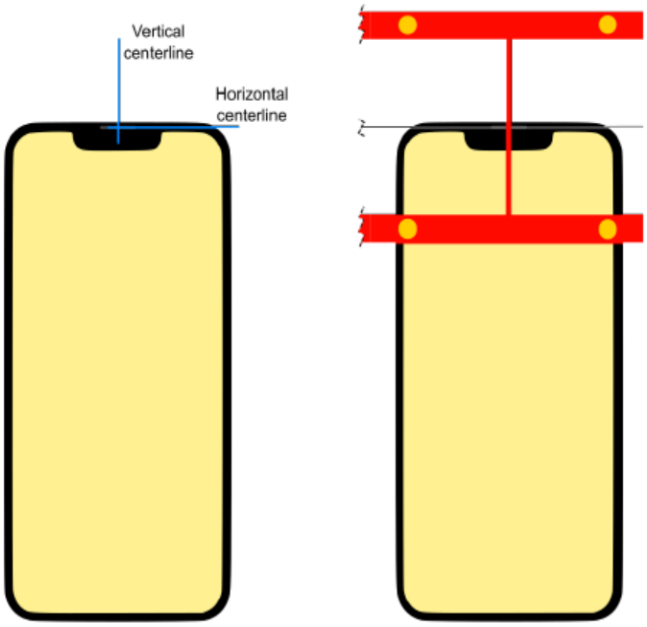

Fig 5.3 Device Under Test Positioning under the Test Arch

Note:

1. The reference plane is the planar area that contains the highest point in the area of the phone that normally rests against the user's ear. It is parallel to the centerline of the receiver area of the phone and is defined by the points of the receiver-end of the WD handset, which, in normal handset use, rest against the ear.
2. The measurement plane is parallel to, and 10 mm in front of, the reference plane.

3. The reference axis is normal to the reference plane and passes through the center of the acoustic output (or the center of the hole array); or may be centered on or near a secondary inductive source. The actual location of the reference axis and resultant measurement area shall be noted in the test report.
4. The measurement area shall be 50 mm by 50 mm. The measurement area for both desired ABM signal and undesired ABM field may be located where the transverse magnetic measurements are optimum with regard to the requirements. However, the measurement area should be in the vicinity of the acoustic output of the WD and shall be located in the same half of the phone as the WD receiver. In a WD handset with a centered receiver and a circularly symmetrical magnetic field, the measurement axis and the reference axis would coincide.
5. Measurements of desired ABM signal strength and undesired ABM field are made at 2.0 mm ± 0.5 mm or 4 mm intervals in an X-Y measurement area pattern over the entire measurement area (676 measurement points total); either all measured, or measured plus interpolated, per 6.4 of ANSI C63.19.
6. Desired ABM signal frequency response is measured at a single location at or near the maximum desired ABM signal strength location.
7. The actual locations of the measurement points shall be noted in the test report.

5.4. System Validation

For correct and calibrated measurement of the voltages and ABM filed, DASY will perform a calibration job follows below:

1. In phase 1, the audio output is switched off, and a 200 mW symmetric rectangular signal of 1 kHz is connected directly to both channels of the sampling unit (Coil in, Probe in).
2. In phase 2, the audio output is off, and a 20 mW symmetric 100 Hz signal is internally connected. The signals during phases 1 and 2 are available at the output on the rear panel of the AMMI. However, the output must not be loaded, in order to avoid influencing the calibration, an RMS voltmeter would indicate 100mWRMS, during the second phase after the first two phases, the two input channels are both calibrated for absolute ants of voltages. The resulting factors are displayed above the multi-meter window.
3. After phases 1 and 2, the input channels are calibrated to measure exact voltages. This is required to use the inputs for measuring voltages with their peak and RMS value.
4. In phase 3, a mulit-sine signal covering each third-octave band from 50 Hz to 10 kHz is generated and applied to both audio outputs. The probe should be positioned in the center of the AMCC and aligned in the z-direction, the filed orientation of the AMCC. The "Coil In" channel is measuring the voltage over the AMCC internal shunt, which is proportional to the magnetic filed in the AMCC. At the same time, the "Probe In" channel samples the amplified signal picked up by the probe coil and provides a numerical integrator. The radio of two voltages in each third-octave filter leads to the spectral representation over the frequency band of interest. The coil signal is scaled in dBV, and the probe signal is first integrated and normalized to show dB A/m. The radio probe-to-coil at the frequency of 1 kHz is the sensitivity which will be used in the consecutive T-coil jobs.

6. T-Coil Test Procedure

6.1. General Description

T-Coil measurement follows Section 6.4 of ANSI C63.19-2019.

This sub clause describes the procedures used to measure the ABM (T-Coil) performance of the WD. Measurements shall be performed over a measurement area 50 mm square, in the measurement plane, as specified in A.3. The measurement area shall be scanned with a uniform measurement point spacing of 2.0 mm ± 0.5 mm in each X-Y axis of the plane, yielding 676 measurement points with approximately even spacing throughout the area.

Optionally, measurement point spacing may be increased to 4 mm, with interpolation employed to yield the required 676 equivalent measurement points distributed uniformly over the 50 mm square measurement area. Interpolated points shall be derived from the average of the linear representations of the field strengths of the nearest two or four equidistant measured points. The area of measurement is increased to a 52 mm square so that edge rows and columns of the required 50 mm square can be either measured or interpolated, with none extrapolated.

In addition to measuring the desired ABM signal levels, the weighted magnitude of the unintended signal shall also be determined. Weighting of the unintended and undesired ABM field shall be by the spectral and temporal weighting described in D.4 through D.6.

In order to assure that the required signal quality is measured, the measurement of the intended signal and the measurement of the unintended signal shall be made at the same locations. Measurements shall not include undesired influence from the WD's RF field; therefore, use of a coaxial connection to a base station simulator or non-radiating load might be necessary. However, even then with a coaxial connection to a base station simulator or non-radiating load there could still be RF leakage from the WD, which could interfere with the desired measurement. Pre-measurement checks should be made to avoid this possibility. All measurements shall be done with the WD operating on battery power with an appropriate normal speech audio signal input level given in Table 6.1. If the device display can be turned off during a phone call, then that may be done during the measurement as well. If tested with the display in the off state this shall be documented in the test report.

Measurements shall be performed with the probe coil oriented in the transverse direction, as illustrated in A.3, that is, aligned in the plane of the measurement area and perpendicular to the long dimension of the WD. A multi-stage sequence consists of first measuring the field strength of the desired T-Coil signal (desired ABM signal) that is useful to a hearing aid T-Coil at each specified measurement point. The undesired magnetic component (undesired ABM field) is then measured in the same transverse orientation at each of

the same measurement points. At a single location only, taken at or near the highest desired ABM signal reading, the desired ABM signal frequency response shall be determined in a third measurement stage. The flowchart in Figure 6.3 illustrates this three-stage process.

To minimize the need to test every WD operating mode to the telecoil requirements of Clause 6, it is permissible to exclude some subset of supported configurations. For a given WD, every mode that supports voice communication shall be considered for telecoil testing. However, if it can be demonstrated that a certain configuration will not be the worst-case telecoil configuration, such configurations may be excluded from the full telecoil scans of 6.4.34 For example, operating modes may be pre-screened by scanning for both desired ABM signal and undesired ABM field at a lower measurement point density than the final scans, thus saving considerable testing time by eliminating configurations that are excellent performers from more detailed testing for worst-case. In any case, the specific methods and criteria used to determine which configurations are excluded for a WD shall be explicitly stated and justified in the test report. To be considered for exclusion from telecoil testing, operating modes shall also be shown to pass the frequency response requirements of 6.6.3.

Many factors could affect telecoil test results. RF power level and amplitude modulation characteristics as well as the specific current paths within the WD associated with the RF output stage(s), the display, and processing circuitry could affect the undesired ABM field. Audio codec implementation and acoustic receiver characteristics could also affect the desired ABM signal). Therefore, any justifications for exclusions should be thorough documented. If an operating mode is under user control and instructions on how to place the WD in a less interfering condition is in the user instructions, those instructions may be followed in configuring the device for testing.

6.2. T-Coil Test Flow

This section follows ANSI C63.19-2019 section 6.4.1:

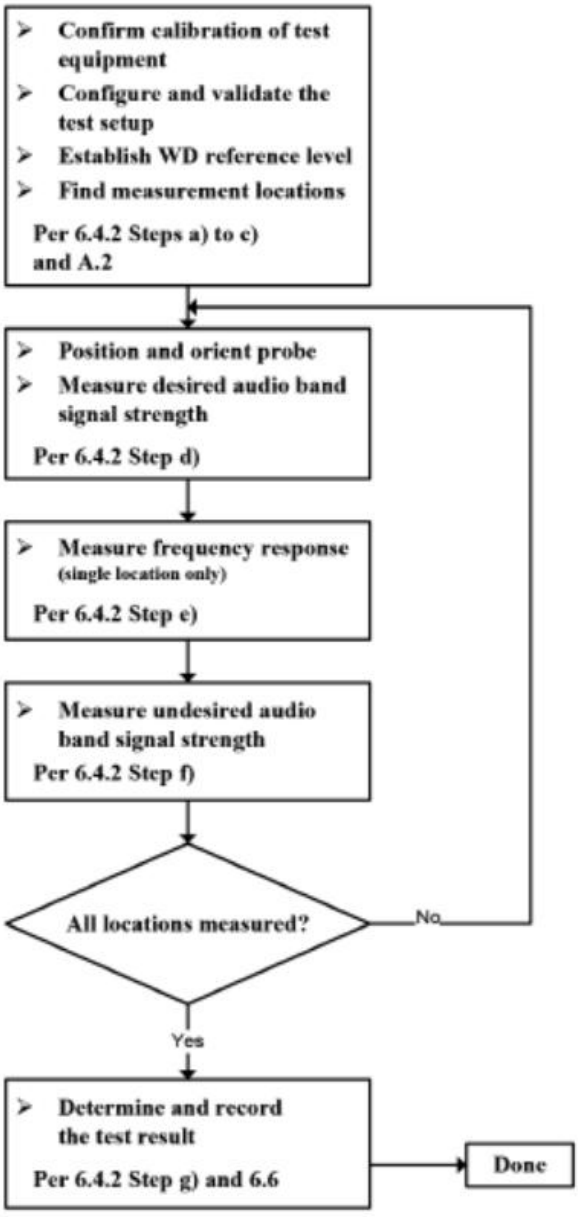

Fig 6.1 WD T-Coil signal test flowchart

Note:

The following steps summarize the basic test flow for determining desired ABM signal and undesired ABM field. These steps assume that a sine wave or narrowband 1/3 octave signal can be used for the measurement of desired ABM signal level. An alternative procedure, yielding equivalent results, using a broadband excitation is described in 6.5 of ANSI C63.19-2019.

1. A validation of the test setup and instrumentation shall be performed. This may be done using a TMFS

or Helmholtz Coil. Measure the emissions and confirm that they are within tolerance of the expected values.

2. Confirm that equipment that requires calibration has been calibrated, and that the noise level meets the requirements given in 6.3.2.
3. Position the WD in the test setup and connect the WD RF connector to a base station simulator or a non-radiating load (if necessary to control RF interference in the measurement equipment) as shown in Figure 6.1 or Figure 6.2.
4. The drive level to the WD is set such that the reference input level specified in Table 6.1 is input to the base station simulator (or manufacturer's test mode equivalent) in the 1 kHz, 1/3 octave band. This drive level shall be used for the T-Coil signal test (desired ABM signal) at f = 1 kHz. Either a sine wave at 1025 Hz, or a voice-like signal, band-limited to the 1 kHz 1/3 octave, as specified in 6.4.3, shall be used for the reference audio signal. If interference is found at 1025 Hz an alternative nearby reference audio signal frequency may be used.35 The same drive level will be used for the desired ABM signal frequency response measurements at each 1/3 octave band center frequency. The WD volume control may be set at any level up to maximum, provided that a signal at any frequency at maximum modulation would not result in clipping or signal overload.
5. At each measurement location over the measurement area and in the transverse orientation, measure and record the desired 1 kHz T-Coil magnetic signal (desired ABM signal) as described in Step c).
6. At or near a location representing a maximum in the just-measured desired ABM signal, measure and record the desired T-Coil magnetic signals (desired ABM signal at fi) as described in 6.4.5.2 in each individual ISO 266:1975 R10 standard 1/3 octave band. The desired audio band input frequency (fi) shall be centered in each 1/3 octave band maintaining the same drive level as determined in Step c), and the reading taken for that band. Equivalent methods of determining the frequency response may also be employed, such as fast Fourier transform (FFT) analysis using noise excitation or input–output comparison using simulated speech. The full-band integrated or half-band integrated probe output, as described in D.9, may be used, as long as the appropriate calibration curve is applied to the measured result, so as to yield an accurate measurement of the field magnitude. (The resulting measurement shall be an accurate measurement in dB (A/m).) Compare the frequency response found to the requirements of 6.6.3.
7. At the same locations measured in Step d), measure and record the undesired broadband audio magnetic signal (undesired ABM field) with no audio signal applied (or digital zero applied, if appropriate) using the specified spectral weighting, the half-band integrator followed by the temporal weighting.
8. Calculate and record the location and number of the measurement points that satisfy both the minimum desired ABM signal level and the maximum undesired ABM field level specified in 6.6.2. Compare this to the requirements in 6.6.4 and record the result.
9. Calculate and record the location and number of the measurement points that satisfy the maximum undesired ABM field level and distribution requirements specified in 6.6.4.

7. Test Equipment List

Manufacturer	Name of Equipment	Type/Model	Serial No. / SW Version	Calibration

8. Test Results for CMRS Voice

8.1. Test Guidance

1. The middle channel of each frequency band is used for T-Coil testing according ANSI C63.19-2019.
2. For VoLTE radio configuration investigation is selected either one codec and an investigation were performed on all frequency band, data rates and modulations and RB configuration to determine the radio configuration to be used for testing, the following tests results which the worst case configuration would be remarked to be used for the testing for the handset.
3. According to KDB 285076, reporting results involves Air Interface Investigation defined following process:
   1) Ratio configuration Investigation: The worst radio configuration (e.g. bandwidth, modulation data rate, subcarrier spacings, and resource blocks) should be investigated and documented.
   2) Codec Investigation to determine the worst-case codec for each voice service, using the worst-case codec for a voice service, a range of channels and bands tested.
   3) Using a frequency near the center of the frequency band to test T-Coil per ANSI C63.19-2019 section 6.3.3.
4. For 5G VoWiFi, the worst frequency band of 802.11a would be selected to test other wireless modes.
5. This device was tested under the maximum volume, backlight off and mute on.
6. HAC mode would be active to improve the audio signal to comply with the T-Coil performance of ANSI C63.19-2019.
7. The device has similar frequency in LTE bands: LTE Band 2/25, LTE Band 5/26, LTE Band 4/66, LTE Band 17/12，LTE Band 18/26, LTE Band 19/26, LTE Band 38/41 since the supported frequency spans for the smaller LTE bands are completely cover by the larger LTE bands, therefore, only larger LTE bands were required to be tested for hearing-aid compliance.
8. The ambient noise test data of band LTE Band 25 is taken as the ambient noise data of all bands, and the test data results are recorded in annex C of this report.
9. The wireless mode of 802.11be would not be tested since the T-coil software provided by the manufacturer does not support WIFI 802.11be mode.
10. This report only recorded the lowest bandwidth of WLAN 2.4/5GHz 802.11ax and maximum bandwidth of WLAN 6GHz 802.11ax mode.
11. All of the frequency bands including codec, channel, bandwidth would be tested T-Coil under the maximum power level with the receiver active.

8.2. Test Results

➢ **GSM Test Results**

<Codec Investigation>

Wireless Band & Channel	Orientation	Codec Bites (Kbps)	Primary Group Contiguous Point Count	Secondary Group Point Count	Secondary Group Max Longitudinal	Secondary Group Max Transverse	Frequency Response
GSM850 /189	Transversal (Y)	**AMR-NB 4.75**	32	236	19	26	PASS
		AMR-NB 12.2	41	246	19	26	PASS

Note: The worst codec of AMR-NB 4.75 Kbps was selected for air interface Investigation.

<Air Interface Investigation>

Air Interface	Mode	Channel	Primary Group Contiguous Point Count	Secondary Group Point Count	Secondary Group Max Longitudinal	Secondary Group Max Transverse	Ambient Noise dB (A/m)	Frequency Response
GSM 850	GSM Voice	189	32	236	19	26	-52.36	PASS
GSM 1900	GSM Voice	661	44	265	17	26	-52.36	PASS

➢ **UMTS Test Results**

<Codec Investigation>

Wireless Band & Channel	Orientation	Codec Bites (Kbps)	Primary Group Contiguous Point Count	Secondary Group Point Count	Secondary Group Max Longitudinal	Secondary Group Max Transverse	Frequency Response
WCDMA II / 9400	Transversal (Y)	**AMR-NB 4.75**	198	470	24	26	PASS
		AMR-NB 12.20	214	477	24	26	PASS

Note: The worst codec of AMR-NB 4.75 Kbps was selected for air interface Investigation.

<Air Interface Investigation>

Air Interface	Mode	Channel	Primary Group Contiguous Point Count	Secondary Group Point Count	Secondary Group Max Longitudinal	Secondary Group Max Transverse	Ambient Noise dB (A/m)	Frequency Response
WCDMA II	AMR	9400	198	470	24	26	-52.36	PASS

9. Test Results for OTT VoIP Application

9.1. T-Coil Measurement Setup for OTT VoIP

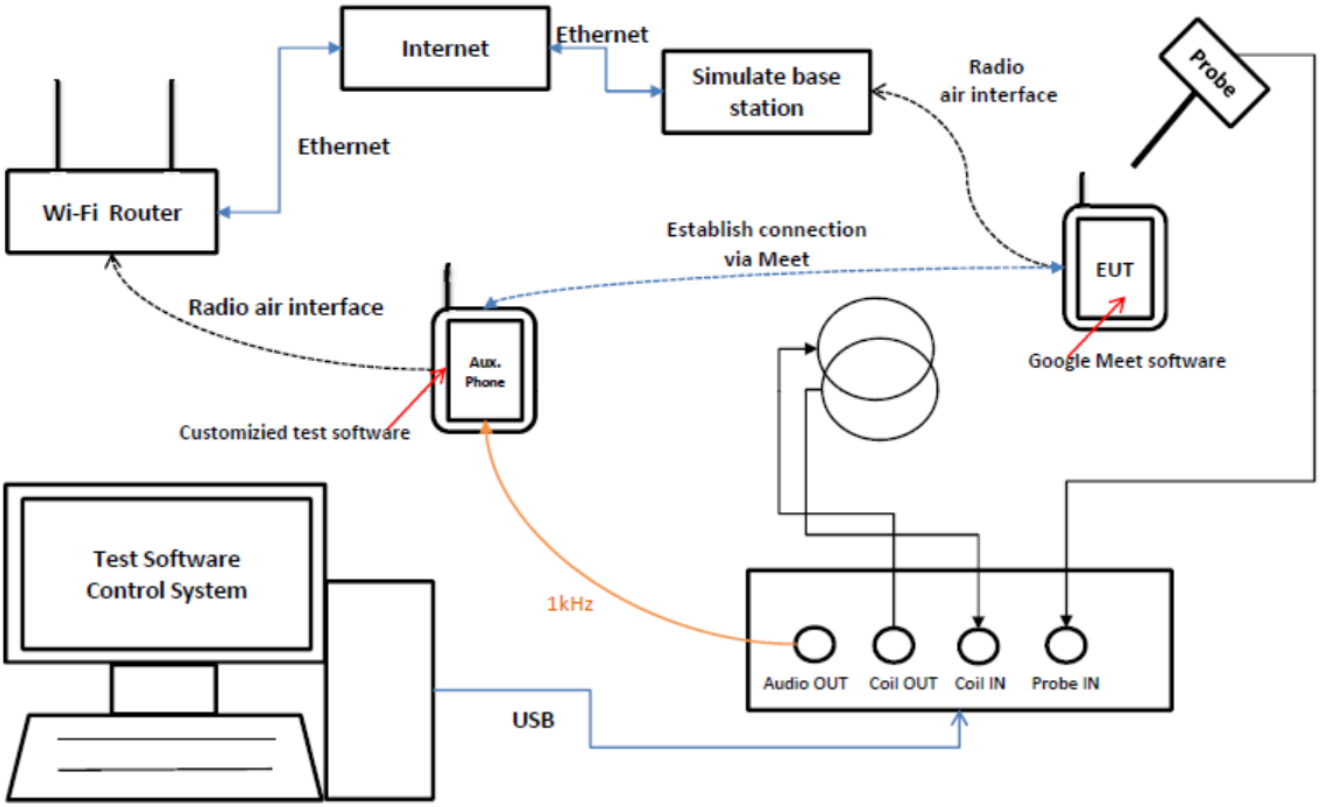

Fig 9.1 Test Setup Configuration for OTT Calling

Note:

1. Define all applicable input audio level as below according to KDB 285076 D02: OTT voice calling input level is -20dBm0.
2. OTT voice, such as that enabled when a user opts to communicate in a voice-only mode using the Google Meet application, is a methodology and group of technologies for the delivery of voice communications and multimedia sessions over the internet. The terms Internet telephony, broadband telephony, communications services (voice, fax, SMS, voice-messaging) over the public Internet, rather than via the public switched telephone network (PSTN).
3. Google Meet application supports codec and bitrate are listed in section 9, and the customized Google Meet software is installed on a mobile phone that is used as the Auxiliary for the test. The software enables the audio coding rate to be changed, and reports the input digital audio level before audio processing, which can be used to calibrate the input audio level.
4. This device comes with the preinstalled OTT application that supports the voice-only communication option on the Google Meet application and related codec. The test configuration establishes a call

between the device under test and an auxiliary handset via Google Meet server.

5. The test setup used for Google Meet OTT voice-only communication is via the data application unit on the station, connected to the internet via the Google Meet server to the auxiliary device. The auxiliary device runs special software that allows the codecs and bit rate to be fixed to a specific value. Please refer to section 9. An assessment was made of each of the different codec bit rates to determine the worst case for each different OTT transport (WIFI, LTE, GSM, WCDMA, NR).
6. The auxiliary device includes software that displays the audio level in dBFS, which allows calibration of the system to establish the -20dBm0 reference level. After establishing the voice-only communication between auxiliary device and device under test, the audio output from the AMMI is injected into the auxiliary device. The gain factor to establish a reference level of -20dBm0 for use during the test is determined as detailed in the next page based on the 0dBFull Scale (OBFS) value being equivalent to 3.14dBm0.
7. Audio Level and Gain Calibration
   1) A more conservative input reference level of -20dBm0 would be used to audio calibration.
   2) The adjusted gain measurements are based on the external Digital Analog Converter (DAC).
   3) Three way's audio files (sine wave, 1kHz voice and 300-3000 kHz) will be sent from the DASY 6 PC to the AMMI, and to the ADC.

9.2. Test Guidance

1. The middle channel of each frequency band is used for T-Coil testing according ANSI C63.19-2019.
2. For VoLTE radio configuration investigation is selected either one codec and an investigation would be performed on all frequency band, data rates and modulations and RB configuration to determine the radio configuration to be used for testing, the following tests results which the worst configuration would be remarked to be used for the testing for the handset.
3. The OTT VoIP T-Coil measurement was performed based on the CMRS service, therefore only the worst air interference would be selected to test GSM, UMTS, LTE, 5G NR and WiFi frequency bands.
4. According to KDB 285076, reporting results involves Air Interface Investigation defined following process:
   a) Ratio configuration Investigation: The worst radio configuration (e.g. bandwidth, modulation data rate, subcarrier spacings, and resource blocks) should be investigated and documented.
   b) Codec Investigation to determine the worst-case codec for each voice service, using the worst-case codec for a voice service, a range of channels and bands tested.
   c) Using a frequency near the center of the frequency band to test T-Coil per ANSI C63.19-2019 section 6.3.3.
5. The test setup used for OTT Voice call is the DUT connect to the CMW500/CMX500 and via the data application unit on CMW500/CMX500 connection to the Internet, the Auxiliary EUT is connected to the

WiFi access point, the channel/Modulation/Frequency bands/data rate is configured on the CMW500/CMX500 for the DUT unit. For the Auxiliary OTT unit which is used to configure the audio codec rate and determine the audio input level of -20dBm0 based on the KDB 285076 D02 requirement.

6. For Google Meet, both the 6Kbps and 75Kbps bit rate of the OPUS auto codec will be used to codec investigating and the worst case used to T-Coil testing.
7. The worst configuration and frequency band of air interface according to VoLTE and VoWiFi test results of air interface investigation for both the OTT service and CMRS IP service are established over the internet protocol for the voice service, and the services use the identical RF air interface for the LTE and WiFi.
8. For OTT VoIP codec investigation test reduction that all of air interfaces have the same codec configuration, therefore the worst codec investigation for LTE Band 41 and WLAN 2.4GHz 802.11g will be used to testing all of air interfaces.
9. This device was tested under the maximum volume, backlight off and mute on.
10. HAC mode would be active to improve the audio signal to comply with the T-Coil performance of ANSI C63.19-2019.

9.3. VoIP Test Results

<Codec Investigation for EDGE>

Wireless Band / Bandwidth / Channel	Orientation	Codec Bites (Kbps)	Primary Group Contiguous Point Count	Secondary Group Contiguous Point Count	Secondary Group Max Longitudinal	Secondary Group Max Transverse	Frequency Response
GSM 850/ 189	Transversal (Y)	**OPUS 6**	131	344	15	26	PASS
		OPUS 40	136	349	15	26	PASS
		OPUS 75	137	374	16	26	PASS

Note: The worst codec of OPUS 6Kbps was selected for air interface Investigation.

<Codec Investigation for HSPA>

Wireless Band / Bandwidth / Channel	Orientation	Codec Bites (Kbps)	Primary Group Contiguous Point Count	Secondary Group Contiguous Point Count	Secondary Group Max Longitudinal	Secondary Group Max Transverse	Frequency Response
WCDMA Band V/ 4182	Transversal (Y)	**OPUS 6**	399	668	26	26	PASS

Annex A General Information

1. Identification of the Responsible Testing Laboratory

Laboratory Name:	Shenzhen Morlab Communications Technology Co., Ltd.
Laboratory Address:	FL.1-3, Building A, FeiYang Science Park, No.8 LongChang Road, Block 67, BaoAn District, ShenZhen, GuangDong Province, P. R. China
Telephone:	+86 755 36698555
Facsimile:	+86 755 36698525

2. Identification of the Responsible Testing Location

Name:	Shenzhen Morlab Communications Technology Co., Ltd.
Address:	FL.1-3, Building A, FeiYang Science Park, No.8 LongChang Road, Block 67, BaoAn District, ShenZhen, GuangDong Province, P. R. China

3. Facilities and Accreditations

The FCC designation number is CN1192, the test firm registration number is 226174.

Annex B Test Setup Photos

The annex B will be submitted separately.

Annex C Plots of T-Coil Test Results

The annex C will be submitted separately.

Annex D DASY Calibration Certificate

The annex D will be submitted separately.

****** END OF MAIN REPORT ******
