Re: Radiated emission evaluation

To whom it may concern:

We, Microelectronics Technology Inc. performed SAR test to mount the module RU-865 into t Panasonic Personal Computer Model FZ-M1. But the Radiated emission testing was not additionally performed due to the following:

- The original FCC testing of the module RU-865 was performed when the antenna was connected to the module in an open environment. Under this application, the RU-865 itself and its antennas installed inside the Host device enclosure. The physical restraints introduced by the Host device enclosure should have resulted in equal or lower level of radiated emission.
- And the original FCC testing of the module RU-865 was performed with an antenna of higher gain (2 dBi). The antenna type (type: PCB) is same as the original but has lower gain across level of radiated emission.

Sincerely,

Hank Lee

QA Assistant Manager
