## 一、Product specification

The report mainly provides the parameter test of N73S antenna performance. The N73S antenna is a 4G antenna. (As shown in Figure 1 below)

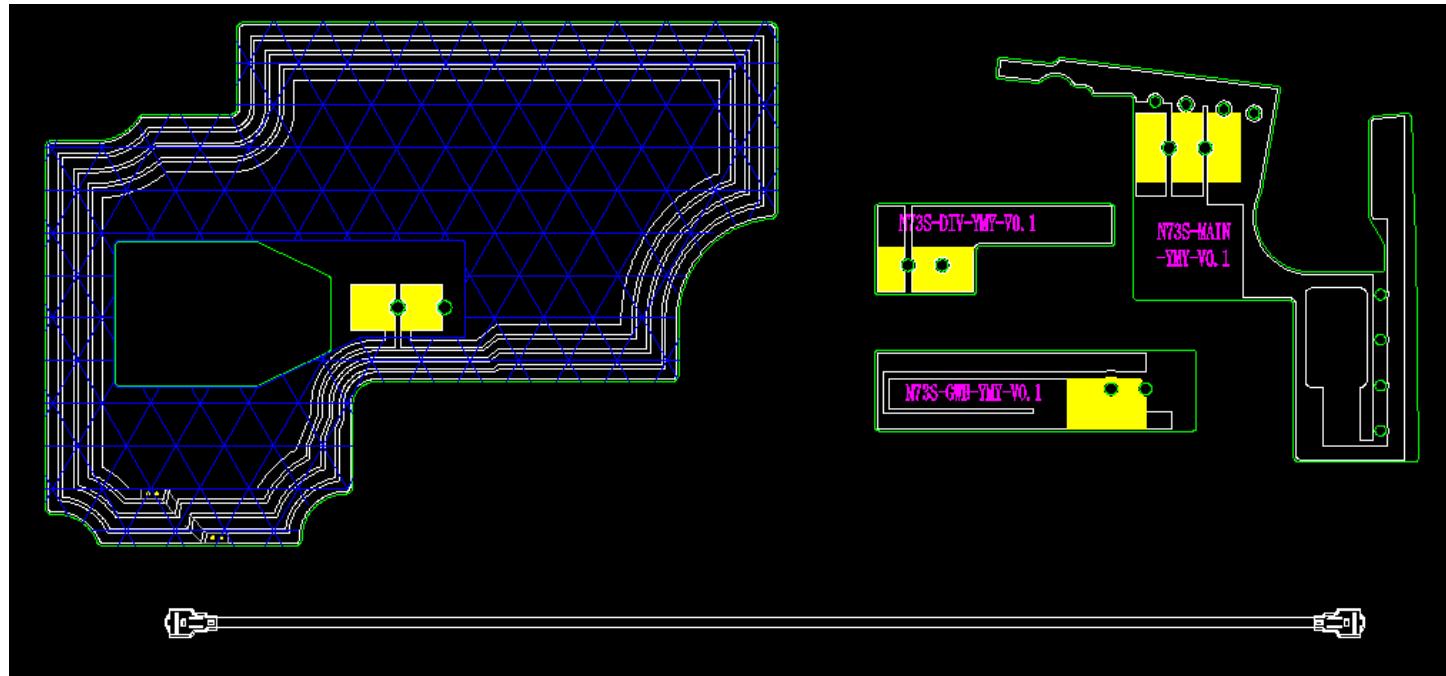

图 1 N73S 天线

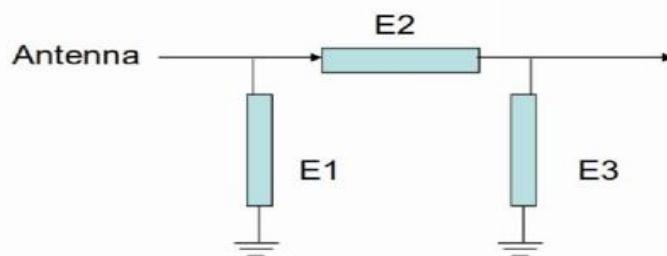

## Second, electrical performance

### 1. Specifications and standards

The N73S antenna operates in the 2400-2500MHZ frequency band and generates resonance in this frequency band.

### 2. Antenna matching circuit

Antenna structure: FPC

Element	Value
E1	NC
E2	0欧姆
E3	NC

### 3. Parameter testing

#### 1. Test Settings

The VSWR test device is connected in sequence as follows:

E5071B Network Analyzer → 50 ohm coaxial Cable → 110mm long copper pipe → Test fixture

Treatment of test fixtures:

From the antenna 50 ohm test point on the PCB of the phone, a hard cable is used to lead out the SMA-J connector, which is connected to the copper tube with the choke, and then connected to the other devices in turn.

2. 测试

#### 4. the setting of active test

**The active test device is connected in sequence as follows:**

Agilent8960 → 50 ohm coaxial Cable → Satimo SG16 test system → Cell phone to be tested

##### 1. Test site

**AW microwave darkroom: The test frequency range is 400MHz - 6GHz, the static zone range is 40cm circle, and the reflectivity is less than -90 dB.**

##### 2. Test results

**The maximum radiated power and maximum receiving sensitivity reflect the maximum radiated power and the best receiving performance of the antenna in the whole radiated space. TRP and TIS reflect the average radiated power and average receiving sensitivity of the antenna, that is, the overall receiving performance of the antenna.**
