3.3.1. Limit

FCC 47 CFR Part 15 Subpart C - § 15.209 (a) The emissions from an intentional radiator shall not exceed the field strength levels specified in the following table:

FCC 47 CFR Part 15 Subpart C - §15.35 (b)

There is also a limit on the radio frequency emissions, as measured using instrumentation with a peak detector function, corresponding to 20 dB above the maximum permitted average limit. Used conversion factor: Limit $(dB\mu V/m) = 20\log (\text{Limit } (\mu V/m)/1\mu V/m)$

3.3.2. Test Setup

30MHz-1GHz Test Setup

Above 1GHz Test Setup

3.3.3. Test Procedures

- 1) The measurement procedure follows ANSI C63.10-2013, clause 6.3, 6.5, 6.6, 6.10.5 and 6.10.6.
- 2) The data of cable loss and antenna factor has been calibrated in full testing frequency range before the testing.
- 3) EUT is placed on a non-conducting table 80cm above the ground plane for measurement below 1GHz; 1.5m above the ground plane for measurement above 1GHz. The antenna to EUT distance is 3 meters.
- 4) For measurements below 30MHz, the resolution bandwidth and video bandwidth is set to 9kHz for quasi-peak detection measurements.

For measurements from 30MHz to 1GHz, the resolution bandwidth is set to 100kHz for peak detection measurements or 120kHz for quasi-peak detection measurements. Peak detection is used unless otherwise noted as quasi-peak.

For pre-scans above 1GHz, the resolution bandwidth is set to 1MHz; the video bandwidth is set to 3MHz for peak measurements.

For final scans above 1GHz, the resolution bandwidth is set to 1MHz and video bandwidth is set to 3MHz for peak measurements. And 1MHz resolution bandwidth with 1/T (10Hz) video bandwidth with peak detector for average measurements.

- 5) The frequency range of interest is monitored at a fixed antenna height and EUT azimuth. The EUT is rotated through 360 degrees to maximize emissions received. The antenna is scanned from 1 to 4 meters above the ground plane to further maximize the emission. Measurements are made with the antenna polarized in both the vertical and horizontal positions.
- 6) The spectrum from 1GHz to 18GHz is investigated with the EUT set to transmit at the lowest, middle and highest channels with the highest output power and worst-case modulation type (defined in section 2.6 of this report). Below 1GHz and above 18GHz emissions were performed with the EUT set to transmit at the channel and modulation type with the highest output power as worst-case scenario.

3.4.2. Test Setup

Test Connection Diagram

3.4.3. Test Procedures

- 1) The measurement procedure follows ANSI C63.10-2013, clause 6.2;
- 2) The EUT was placed 0.4 meters from the conducting wall of the shielded room with EUT being connected to the power mains through a line impedance stabilization network (LISN). Other support units were connected to the power mains through another LISN. The two LISNs provide 500hm/50uH of coupling impedance for the measuring instrument;
- 3) Both lines of the power mains connected to the EUT were checked for maximum conducted interference;
- 4) The frequency range from 150kHz to 30MHz was searched. Emission levels under limit -20dB were not recorded;
- 5) The resolution bandwidth and video bandwidth of test receiver is 9kHz for quasi-peak detection (QP) and average detection (AV) at frequency 0.15MHz-30MHz;
- 6) The EUT shall test under the power AC120V/60Hz.

3.4.4. Test Result

N/A

Note:

This test was not performed since the EUT is only powered by battery.

3.4.5. Uncertainty

 $U_{lab}=3.0 dB, k=2 (U_{Cispr}=3.4 dB)$

Determining compliance with the limits shall be based on the results of the compliance measurements, taking into account the considerations on measurement instrumentation uncertainty. Because Ulab is equal to UCISPR (as specified in CISPR16-4-2), then:

-compliance is deemed to occur if no measured disturbance exceeds the disturbance limit; -non-compliance is deemed to occur if any measured disturbance exceeds the disturbance limit;
