

- 5) The response does not appear to address the following from the original review:
- The submitted label appears to be an adhesive paper label. Both the FCC (in Section 2.925(d)(1) of the FCC Rules) and IC (in Section 5.2 of RSS-Gen) have requirements that the label must be durable in order to last the expected lifetime of the device. Please describe the material of which this label is made in an amended label exhibit.

WLL: Production units use a laminated label which is also covered by the board's conformal coating. This ensures that the label is permanently affixed to the PCBA. The updated photos (Pictures - Internal.pdf) reflect this change over the earlier paper label placeholder.

The label with the HVIN/Model number (10154953) is shown in Figure 2 of the same document (Pictures - Internal.pdf). The FCC/IC label is placed on the bottom of the PCBA, while the HVIN/Model number label is placed on the top of the PCBA.
