Valdis V. Liepa, Ph.D. Valdis V. Liepa, Ph.D.
Report by: Valdis V. Liepa Report Date of Issue: October 19, 2014
Valdis V. Liepa, Ph.D.

Results of testing completed on (or before) October 15, 2014 are as follows.

Emissions: The transmitter intentional emissions **COMPLY** with the regulatory limit(s) by no less than 19.3 dB.
Transmit chain spurious harmonic emissions **COMPLY** by no less than 32.8 dB.

1 Test Specifications, General Procedures, and Location

1.1 Test Specification and General Procedures

The ultimate goal of Delphi Electronics & Safety is to demonstrate that the Equipment Under Test (EUT) complies with the Rules and/or Directives below. Detailed in this report are the results of testing the Delphi Electronics & Safety L2C0054TR for compliance to:

Country/Region	Rules or Directive	Referenced Section(s)
United States	Code of Federal Regulations	CFR Title 47, Part 15.253
Canada	Industry Canada	IC RSS-210/GENe

Delphi Electronics & Safety has determined that the equipment under test is subject to the rules and directives above at the date of this testing. In conjunction with these rules and directives, the following specifications and procedures are followed herein to demonstrate compliance (in whole or in part) with these regulations.

ANSI C63.4-2003	"Methods of Measurement of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the Range of 9 kHz to 40 GHz"
KDB 200443 D02 MMW	"FCC/TCB Council Millimeter Wave Test Procedures"
Industry Canada	"The Measurement of Occupied Bandwidth"

1.2 Test Location and Equipment Used

Test Location The EUT was fully tested by **The University of Michigan Radiation Laboratory**, 3228 EECS Building, Ann Arbor, Michigan 48109-2122 USA. The Test Facility description and attenuation characteristics are on file with the FCC Laboratory, Columbia, Maryland (FCC Reg. No: 91050) and with Industry Canada, Ottawa, ON (File Ref. No: IC 2057A-1).

Test Equipment Pertinent test equipment used for measurements at this facility is listed in Table 1. The quality system employed at The University of Michigan Radiation Laboratory has been established to ensure all equipment has a clearly identifiable classification, calibration expiry date, and that all calibrations are traceable to the SI through NIST, other recognized national laboratories, accepted fundamental or natural physical constants, ratio type of calibration, or by comparison to consensus standards.

2 Configuration and Identification of the Equipment Under Test

2.1 Description and Declarations

The EUT is an automotive radar. The EUT is approximately 25 x 9 x 3 cm (approx.) in dimension, and is depicted in Figure 1. It is powered by a 13.2 VDC vehicle power system. In use, this device is permanently affixed in a motor vehicle. Table 2 outlines provider declared EUT specifications.

Figure 1: Photos of EUT.

Table 2: EUT Declarations.

General Declarations			
Equipment Type:	Radar	Country of Origin:	Not Declared
Nominal Supply:	13.2 VDC	Oper. Temp Range:	-40° C to +85° C
Frequency Range:	76.593 to 76.990 GHz	Antenna Dimension:	8 cm
Antenna Type:	integral patch arrays	Antenna Gain:	22 dBi (maximum)
Number of Channels:	Not Declared	Channel Spacing:	Not Declared
Alignment Range:	Not Declared	Type of Modulation:	FMCW
United States			
FCC ID Number:	L2C0054TR	Classification:	FDS
Canada			
IC Number:	3432A-0054TR	Classification:	Radar, Vehicular Device

2.1.1 EUT Configuration

The EUT is configured for testing as depicted in Figure 2.

2.1.2 Modes of Operation

The manufacturer considers the modes of operation of this product to be of a proprietary nature. Please reference the confidential Modes of Operation exhibit for complete details.

Figure 2: EUT Test Configuration Diagram.

2.1.3 Variants

There is only a single variant of the EUT, as tested.

2.1.4 Test Samples

A laptop was provided to setup radar functionality over the CAN bus, directing the radar to operate in both the normal dual chirp modulated mode and CW within the chirp band. Two test samples in total were provided. One normal sample for testing and one sample to take apart for photos.

2.1.5 Functional Exerciser

Normal operating EUT functionality was verified by observation LO(VCO) of the receiver.

2.1.6 Modifications Made

No modifications were made to the EUT.

2.1.7 Production Intent

The EUT appears to be a production ready sample.

2.1.8 Declared Exemptions and Additional Product Notes

The EUT is permanently installed in a transportation vehicle. As such, digital emissions are exempt from US and Canadian digital emissions regulations (per FCC 15.103(a) and IC correspondence on ICES-003).

3 Emissions

3.1 General Test Procedures

3.1.1 Radiated Test Setup and Procedures

Radiated electromagnetic emissions from the EUT are first evaluated in our shielded fully anechoic chamber. Spectrum and modulation characteristics of all emissions are recorded, and emissions above 1 GHz are fully characterized. The anechoic chamber contains a set-up similar to that of our outdoor 3-meter site, with a turntable and antenna mast. Instrumentation, including spectrum analyzers and other test equipment as detailed in Section 1.2 are employed. After indoor pre-scans, emission measurements are made on our outdoor 3-meter Open Area Test Site (OATS). If the EUT connects to auxiliary equipment and is table or floor standing, the configurations prescribed in ANSI C63.4 / CISPR-22 are followed. Alternatively, a layout closest to normal use (as declared by the provider) is employed if the resulting emissions appear to be worst-case in such a configuration. See Figure 3. All

Figure 3: Radiated Emissions Diagram of the EUT.

intentionally radiating elements that are not fixed-mounted in use are placed on the test table lying flat, on their side, and on their end (3-axes) and the resulting worst case emissions are recorded. If the EUT is fixed-mounted in use, measurements are made with the device oriented in the manner consistent with installation and then emissions are recorded.

If the EUT exhibits spurious emissions due to internal receiver circuitry, such emissions are measured with an appropriate carrier signal applied. For devices with intentional emissions below 30 MHz, a shielded loop antenna is used as the test antenna. It is placed at a 1 meter receive height and appropriate low frequency magnetic field extrapolation to the regulatory limit distance is employed. Emissions between 30 MHz and 1 GHz are measured using tuned dipoles and/or calibrated broadband antennas. For both horizontal and vertical polarizations, the test antenna is raised and lowered from 1 to 4 m in height until a maximum emission level is detected. The EUT is then rotated through 360° in azimuth until the highest emission is detected. The test antenna is then raised and lowered one last time from 1 to 4 m and the worst case value is recorded. Emissions above 1 GHz are characterized using standard gain horn antennas or calibrated broadband ridge-horn antennas. Care is taken to ensure that test receiver resolution and video bandwidths meet the regulatory requirements, and that the emission bandwidth of the EUT is not reduced. Photographs of the test setup employed are depicted in Figure 4.

Where regulations allow for direct measurement of field strength, power values (dBm) measured on the test receiver / analyzer are converted to dBμV/m at the regulatory distance, using

$$E_{dist} = 107 + P_R + K_A - K_G + K_E - C_F$$

where P_R is the power recorded on spectrum analyzer, in dBm, K_A is the test antenna factor in dB/m, K_G is the combined pre-amplifier gain and cable loss in dB, K_E is duty correction factor (when applicable) in dB, and C_F is

a distance conversion (employed only if limits are specified at alternate distance) in dB. This field strength value is then compared with the regulatory limit. If effective isotropic radiated power (EIRP) is compute, it is computed as

$$EIRP(dBm) = E_{3m}(dB\mu V/m) - 95.2.$$

When presenting data at each frequency, the highest measured emission under all possible EUT orientations (3-axes) is reported.

Where regulations call for substitution method measurements, the EUT is replaced by a substitution dipole or standard gain antenna if field strength measurements indicate the emission is close to the regulatory limit. This antenna is co-polarized with the test antenna and tuned (when necessary) to the emission frequency, after which the test antenna height is again optimized. The substitution antenna input signal level is then adjusted such that its emission is equal to the level measured from the EUT. The signal level applied to the substitution antenna is then recorded. Effective isotropic radiated power (EIRP) and effective radiated power (ERP) in dBm are formulated from

$$EIRP = P_T - G_A = ERP + 2.16, \quad (1)$$

where P_T is the power applied to substitution antenna in dBm, including correction for cable loss, and G_A is the substitution antenna gain, in dBi.

When microwave measurements are made at a range different than the regulatory distance or made at close-range to improve receiver sensitivity, the reading is corrected back to the regulatory distance. This is done using a 20 dB/decade far-field behavior relation and a 40 dB/decade near-field relation, as outlined in the FCCs mm-wave measurement procedures. The near-field/far-field boundary (N/F) is computed based on

$$N/F = 2D^2/\lambda$$

where D is the maximum dimension of the transmitter or receiver antenna, and λ is the wavelength at the measurement frequency. For example, suppose $N/F = 2$ m, but the measurement is made at 1 m. Here, the 40 dB/decade relation would be applied from 1 to 2 m, and the 20 dB/decade relation would be applied from 2 to 3 m. In dB, this gives a 15.6 dB adjustment. Typically, for microwave measurements either the receive antenna is connected directly to the spectrum analyzer, or it is connected to an external mixer followed by an insignificant length of cable. In this case, no cable loss term is used and mixer conversion losses are programmed in the spectrum analyzer to be included in the recorded dB values.

Figure 4: Radiated Emissions Test Setup Photograph(s).

3.1.2 Conducted Emissions Test Setup and Procedures

Vehicle Power Conducted Spurious The EUT is not subject to power line conducted emissions regulations as it is powered solely by the vehicle power system for use in said motor vehicle.

3.1.3 Power Supply Variation

Tests at extreme supply voltages are made if required by the the procedures specified in the test standard, and results of this testing are detailed in this report.

3.2 Intentional Emissions

3.2.1 Fundamental Emission Pulsed Operation

The details and results of testing the EUT for pulsed operation are summarized in Table 3. Plots showing the measurements made to obtain these values are provided in Figure 5.

MR FMCW (Subfigure (a))	13.4	76.750	76.0	16.0		0.055	0.00125	291	0.364	-26.2
LR FMCW(Subfigure (b))	13.4	76.950	76.0	16.7		0.055	0.00175	304	0.531	-24.5
LR Dwell (Subfigure (c))	13.4	76.983	150.8	61.7		150.800	61.67000	1	61.670	-2.1
MR Dwell	13.4	76.662	150.8	23.7		150.800	23.73000	1	23.730	-6.2
Total Duty over Time			150.8	150.8	0.0	Worst-Case On-Time in 1MHz IFBW; 100 ms window				-2.1

(1) Mid Range Chirp observed at low end (see subfigure (a)). Mid + Long Chirp near upper end (see subfigure (b)). Max Dwell (when not Chirping) observed at high end (subfigure (c)).

(2) Mid-Range On-Time = 16.0 ms (FMCW sweep – wide band), occurs once every 76 ms chirp cycle.

Long Range On-Time = 16.7 ms (FMCW sweep – narrower band), occurs once every 76 ms chirp cycle.

LR Dwell On-Time = 61.7 ms (CW source rests at 76.98 GHz for 61.7 ms every 150.8 ms (e.g. 2 cycles)), remaining time spent at 76.662 GHz (MR Dwell).

(3) Exposure Duty Correction = $10 \cdot \log(\text{On-Time/Cycle-Time})$; EUT dwells with CW in-band when not chirping, and is therefore on 100% of the time.

(4) Max Dwell / MHz / Chirp is the measured worst case pulse length measured in any given 1 MHz RBW, per chirp.

(5) Chirps / On-Time = On-Time / FMCW Period

(6) Spread Duty = $10 \cdot \log_{10}(\text{Max On-Time/Cycle} / \text{Total Cycle Time})$; Worst-case is when EUT sits at 76.98 GHz for 61.7 ms / 100 ms window.

Equipment Used: HP8560E1, HP8593E1, HP11970W1, WBAND1

Figure 5(c): Pulsed Emission Characteristics (Duty Cycle).

3.2.2 Fundamental Emission Bandwidth

Emission bandwidth (EBW) of the EUT is measured with the device placed in the worst case test mode. Radiated emissions are recorded following the test procedures listed in Section 1.1. The 20 dB EBW is measured as the max-held peak-detected signal when the IF bandwidth is greater than or equal to 1% of the receiver span. For complex modulations other than ASK and FSK, the 99% emission bandwidth per IC test procedures has a different result, and is also separately reported. The results of EBW testing are summarized in Table 4. Plots showing measurements employed to obtain the emission bandwidth reported are provided in Figure 6.

(1) Avg. is computed from the Peak measurement via the worst-case Spread Duty Cycle detailed in the Duty Cycle section of this test report.

(2) CF is computed assuming a 40 dB/decade Near-Field Decay Rate and a 20 dB/Decade Far-field Decay Rate. DR is Regulatory Range Distance. MR is Measurement Distance. N/F is near-far boundary.

(3) EIRP is computed from field strength at 3 meter distance. If emission is within 6 dB of regulatory limit, then substitution method measurement is employed to determine exact EIRP.

(4) Dimension of antenna is taken to be the larger of the test antenna and the DUT antenna; DUT antenna is 8cm in dimension.

3.2.4 Exposure and Potential Health Hazard

To demonstrate compliance with regulations that place limitations on human electromagnetic field exposure for both the general public and for workers, we measured localized field strength in close proximity to the EUT. These levels are compared with limits placed by the directives and recommendations detailed in Section 1.1. Table 6 details the results of these computations.

Table 6: Electromagnetic Field Exposure.

		Test Date:		25-Aug-14

2			THE EUT EMPLOYS NO INTERNAL OSCILLATORS OR CRYSTALS BELOW 40 GHZ RELATED TO THE RF CHAIN (TX OR RX) FOR THE DEVICE. THE EUT IS PHASE LOCKED FROM A 62.9 MHZ CRYSTAL. ANY EMISSIONS BELOW 40 GHZ WOULD BE NON-RF RELATED (DIGITAL) EMISSIONS WHICH ARE EXEMPT FOR VEHICULAR MOUNTED APPLICATIONS.

* CF is computed assuming a 40 dB/decade Near-Field Decay Rate and a 20 dB/Decade Far-field Decay Rate. DR is Regulatory Range Distance. MR is Measurement Distance.

** EIRP is computed from field strength at 3 meter distance. If emission is within 6 dB of regulatory limit, then substitution method measurement is employed to determine exact EIRP.

*** Dimension of antenna is taken to be larger of the test antenna and the DUT antenna; DUT antenna is 8cm in dimension.
