## 12. Radio Frequency Exposure

## 12.1 Applicable Standards

The measurements shown in this test report were made in accordance with the procedures given in FCC Part 2 (Section 2.1091)

### 12.2 EUT Specification

Frequency band	☐ WLAN: 2412MHz ~ 2462MHz						
(Operating)	⊠ Bluetooth: 2402MHz ~ 2480MHz						
Davisa astagany	☐ Portable (<20cm separation)						
Device category							
Exposure	Occupational/Controlled exposure						
classification	☐ General Population/Uncontrolled exposure						
Antenna diversity	Single antenna						
	☐ Multiple antennas						
	☐ Tx diversity						
	Rx diversity						
	☐ Tx/Rx diversity						
Evaluation applied	☐ SAR Evaluation						
	□ N/A						
Remark:							
1. The maximum conducted output power is <u>7.01dBm (5.023mW)</u> at <u>2480MHz</u> (with <u>0dBi</u>							
antenna gain.)							
2. DTS device is not subject to routine RF evaluation; MPE estimate is used to justify the							
compliance.							
3. For mobile or fixed location transmitters, no SAR consideration applied. The maximum							
power density is 1.0 mW/cm <sup>2</sup> even if the calculation indicates that the power density							
would be larger.

#### 12.3 Test Results

No non-compliance noted.

#### 12.4 Calculation

Given 
$$E = \frac{\sqrt{30 \times P \times G}}{d}$$
 &  $S = \frac{E^2}{3770}$ 

Where E = Field strength in Volts / meter

P = Power in Watts

G = Numeric antenna gain

*d* = *Distance in meters* 

S = Power density in milliwatts / square centimeter

Combining equations and re-arranging the terms to express the distance as a function of the remaining variables yields:

$$S = \frac{30 \times P \times G}{3770d^2}$$

Changing to units of mW and cm, using:

$$P(mW) = P(W) / 1000$$
 and

d(cm) = d(m) / 100

Yields

$$S = \frac{30 \times (P/1000) \times G}{3770 \times (d/100)^2} = 0.0796 \times \frac{P \times G}{d^2}$$
 Equation 1

Where d = Distance in cm

P = Power in mW

G = Numeric antenna gain

 $S = Power density in mW / cm^2$
