# **ANNEX A: Detailed Test Results**

### A.1. Measurement Method

#### **Conducted Measurements**

- 1). Connect the EUT to the test system correctly.
- 2). Set the EUT to the required work mode.
- 3). Set the EUT to the required channel.
- 4). Set the spectrum analyzer to start measurement.
- 5). Record the values.

#### **Radiated Emission Measurements**

#### Test setup:

#### 9kHz-30MHz:

The EUT are measured in a anechoic chamber. The EUT is placed on a non-conductive stand of 80cm high, and at a measurement distance of 3m from the receiving antenna. The center of the receiving loop antenna is 1.0 meter above the ground. The test setup refers to figure below. Detected emissions were maximized at each frequency by rotating the EUT and adjusting the receiver antenna polarization.

#### 30MHz-40GHz:

The EUT are measured in a anechoic chamber. The EUT is placed on a non-conductive stand of 80cm high, and at a measurement distance of 3m from the receiving antenna. The center of the receiving antenna is 1.0 meter to 4.0 meter above the ground. The test setup refers to figure below. Detected emissions were maximized at each frequency by rotating the EUT and adjusting the receiver antenna polarization.

#### 30MHz-1GHz:

#### 1GHz-3GHz:

### 3) AC Power line Conducted Emission Measurement

For WLAN, the EUT is working under test mode. The EUT is commanded to operate at maximum transmitting power.

### A.2. Maximum output Power

#### Measurement Limit and Method:

Standard	Frequency (MHz)	Limit (dBm)
FCC CRF Part 15.407(a)	5725MHz~5850MHz	30

Limit use the less value, and B is the 26dB bandwidth.

#### Measurement of method: See ANSI C63.10-2013-Clause 12.3.3.2.

Method PM-G is a measurement using a gated RF average power meter.

Measurements may be performed using a wideband gated RF power meter provided that the gate parameters are adjusted such that the power is measured only when the EUT is transmitting at its maximum power control level. Because the measurement is made only during the ON time of the transmitter, no duty cycle correction factor is required.

#### Measurement Results:

#### ANT3:

Test Mode	Transmitter output power (dBm)			
	5745 MHz (CH149)	5785 MHz (CH157)	5825 MHz (CH165)	
802.11a	14.94	14.86	15.07

/	5775 MHz (CH155)			
802.11ac-VHT80	14.66			

#### Note:

The data rate 6Mbps (11a mode), MCS0 (11n mode) and MCS0 (11ac mode) are selected as the worst case. **802.11a** mode is selected as the worst condition. The following cases and test graphs are performed with this condition.

The EUT was programmed to be in continuously transmitting mode and the transmit duty cycle is not less than 98%.

#### **Conclusion: PASS**

### A.3. Peak Power Spectral Density (conducted)

#### Measurement of method: See KDB 789033 D02 v02r01, Section F.

#### Measurement Limit:

Standard	Frequency (MHz)	Limit
FCC CRF Part 15.407(a)	5725MHz~5850MHz	30dBm/500kHz

The PPSD measurement method SA-1 is made according to KDB 789033.

The measurement is made according to KDB 789033.

In addition, radiated emissions which fall in the restricted bands, as defined in § 15.205(a), must also comply with the radiated emission limits specified in § 15.209(a) (see § 15.205(c)).

#### Limit in restricted band:

A "reference path loss" is established and the  $A_{Rpl}$  is the attenuation of "reference path loss", and including the gain of receive antenna, the gain of the preamplifier, the cable loss.  $P_{Mea}$  is the field strength recorded from the instrument. The measurement results are obtained as described below: Result =  $P_{Mea}$  +  $A_{Rpl}$  =  $P_{Mea}$  + Cable Loss + Antenna Factor
