We have declared below featured for device identified as

FCC ID:2AG6N-C20DS

IC: 23725-C20DS

(1) DFS device: ☐ Master device ☐ Client with Radar detection capability
☒ Client without radar detection capability ☐ N/A

(2) Active / Passive Scanning, Ad-Hoc mode access point capability

(3) Country code selection capability to end user: ☐ Yes ☒ No

(4) Transmission in 5600 MHz to 5650 MHz is notched: ☒ Yes ☐ No

(5) Meet Part 15.202 requirement: ☒ Yes ☐ No

- A master device is defined as a device operating in a mode in which it has the capability to transmit without receiving an enabling signal. In this mode it is able to select a channel and initiate a network by sending enabling signals to other devices. A network always has at least one device operating in master mode.
- A client device is defined as a device operating in a mode in which the transmissions of the device are under control of the master. A device in client mode is not able to initiate a network.

(6) For client devices that have software configuration control to operate in different modes (active scanning in some and passive scanning in others) or in different bands (devices with multiple equipment classes or those that operate on non-DFS frequencies), or modular devices that configure the modes of operations through software; the applicant must provide in the equipment authorization application a software and operations description that discuss how the software and / or hardware is implemented to ensure that proper operations modes cannot be modified by an end user or an installer.
