Certification of Compliance

CFR 47 Part 15 Subpart B

Test Report File No.	05-IST-0172	**Date of Issue**	April 14, 2005
Model(s)	RV4000 (Cinevision)	○ Basic ● Alternated	
	SV294 (SENSORY SCIENCE)	○ Basic ● Alternated	
	DF-S04 (DAEWOO)	○ Basic ● Alternated	
	VR2940 (Go-Video)	○ Basic ● Alternated	
	VR2945 (Go-Video)	○ Basic ● Alternated	
Kind of Product	DVD Recorder + VCR		
Applicant	Daewoo Electronics Corporation.		
	543, Dangjung-Dong, Kunpo-City, Kyounggi-DO, Korea		
Manufacturer	Daewoo Electronics Corporation.		
	295, Gondan-dong, Kumi-city, Kyungsangbuk-do, Korea.		

Test Result ☒ **Positive** ☐ **Negative**

- Investigations requested : Measurement to the relevant clauses of F.C.C rules and regulations Part 15 Subpart B – Unintentional Radiatiors
- The test report with appendix consists of 30 pages.
- The test result only responds to the tested sample.
- It is not allowed to copy this report even partly without the allowance of IST EMC Laboratory.
- This equipment as for has been shown to be capable of continued compliance with the applicable technical standards as indicated in the measurement report and was tested in accordance with the measurement procedures specified in ANSI C63.4 2003.

ENVIRONMENTAL CONDITIONS

Temperature	17 ℃
Humidity	48 %
Atmospheric pressure	1004 mbar

POWER SUPPLY SYSTEM USED

Power supply system	120Vac , 60Hz

PRODUCT INFORMATIONS

Power requirements	120Vac , 60Hz
Power consumption	34W
Operating conditions	41°F to 95°F(5°C to 35°C) , 5% to 90%(humidity)
Mass(approx.)	13.5lbs(6.18kg)
Dimensions(approx.)	16.9X3.54X14.0 inches(430X91X354mm) (wXhXd)
Signal system	NTSC
Antenna IN / RF OUT	Antenna or CATV input,75Ω / Channel 3 or 4 (Switchable)
Signal-to-noise ratio	43dB(VCR) , More than 95dB(DVD)
Head system	4 Head Video, 2 Head Hi-Fi helical scan azimuth system
Laser system	Semiconductor laser, wavelength 650mm
Inputs	Video/Audio(RCA jack)
Outputs	Video/Audio(RCA jack), S-video, component(RCA jack)

- EMC suppression device is not used during the test.
- Please refer to user's manual.

DESCRIPTIONS OF TEST

Conducted Emissions:

The measurement were performed over the frequency range of 0.15MHz to 30MHz using a 50Ω/50uH LISN as the input transducer to a Spectrum Analyzer or a Field Intensity Meter. The measurements were made with the detector set for "Peak" amplitude within an bandwidth of 10KHz or for "quasi-peak" within a bandwidth of 9KHz.

- Procedure of Test

The line-conducted facility is located inside a shielded room No.1. A 1m X 1.5m wooden table 80cm height is placed 40cm away from the vertical wall and 1.5m away from the other wall of the shielded room. The R/S ESH3-Z5 and EMCO 3825/2 LISN are bonded to bottom of the shielded room. The EUT is located on the wooden table with distance more than 80cm from the LISN and powered from the EMCO LISN .The peripheral equipment is powered from the other LISN. Power to the LISNs are filtered by a noise cut power line filters. All electrical cables are shielded by braided tinned steel tubing with inner ϕ 1.2cm. If the EUT is a DC-powered device, power will be derived from the source power supply it normally will be powered from and this supply lines will be connected to the EMCO LISN. All interconnecting cables more than 1m were shortened by non-inductive bundling to a 1m length. Sufficient time for the EUT, support equipment, and test equipment was allowed in order for them to warm up to their normal operating conditions. The RF output of the LISN was connected to the R/S receiver to determine the frequency producing the maximum emission from the EUT. The frequency producing the maximum level was reexamined using Quasi-Peak mode by manual measurement, after scanned by automatic Peak mode for frequency range from 0.15 to 30MHz. The bandwidth of the receiver was set to 10kHz. The EUT, peripheral equipment, and interconnecting cables were arranged and manipulated to maximize each EME emission.

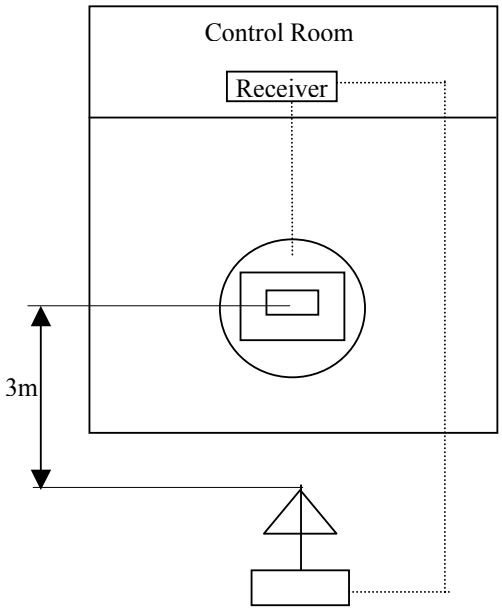
DESCRIPTION OF TEST

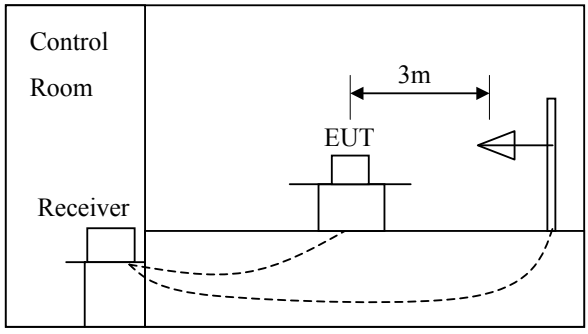
Radiated Emissions:

The measurement was performed over the frequency range of 30MHz to 1GHz using antenna as the input transducer to a Spectrum analyzer or a Field Intensity Meter. The measurement was made with the detector set for "quasi-peak" within a bandwidth of 120KHz.

- Procedure of Test

Preliminary measurements were made at 3 meter using bi-conical and log-periodic antennas, and spectrum analyzer to determine the frequency producing the max. emission in anechoic chamber. Appropriate precaution was taken to ensure that all emission from the EUT were maximized and investigated. The system configuration, mode of operation, turn table azimuth and height with respect to the antenna were noted for each frequency found. The spectrum was scanned from 40MHz to 300MHz using S/B bi-conical antenna and 300 to 1000MHz using S/B log-periodic antenna. Above 1GHz, linearly polarized double ridge horn antennas were used. Final measurements were made at open site with 3-meters test distance using S/B bi-log antenna or horn antenna. The OATS have been verified in regular for its normalized site attenuations. The test equipment was placed on a wooden table. Sufficient time for the EUT, peripheral equipment, and test equipment was allowed in order for them to warm up to their normal operating condition. Each frequency found during pre-scan measurements was re-examined by manual. The detector function was set to CISPR quasi-peak mode and the bandwidth of the receiver was set to 120kHz or 1MHz depending on the frequency of type of signal. The EUT, peripheral equipment and interconnecting cables were re-configured to the set-up producing the max. emission for the frequency and were placed on top of a 0.8-meter high nonmetallic 1 x 1.5 meter table. The EUT, peripheral equipment, and interconnecting cables were re-arranged and manipulated to maximize each emission. The turntable containing the system was rotated; the antenna height was varied 1 to 4 meters and stopped at the azimuth or height producing the maximum emission. Each emission was maximized by: varying the mode of operation to the EUT and/or peripheral equipment and changing the polarity of the antenna, whichever determined the worst-case emission.





SUMMARY

■ Conducted Emission

The requirements are	● MET	○ Not MET
Minimum limit margin	3.1dB at 4.190MHz	
Maximum limit exceeding		

Remarks : With Live phase for average detect mode (DVD playback +VCR REC , LG Tuner)

■ Radiated Emission

The requirements are	● MET	○ Not MET
Minimum limit margin	3.1dB at 346.4MHz	
Maximum limit exceeding		

Remarks : At DVD playback + VCR REC , LG Tuner

☐ Output Signal Level Measurements

The requirements are	○ MET	○ Not MET
Minimum limit margin		
Maximum limit exceeding		

Remarks :

☐ Output Terminal Conducted Spurious Emission

The requirements are	○ MET	○ Not MET
Minimum limit margin		
Maximum limit exceeding		

Remarks :

☐ Transfer Switch Isolation Measurements

The requirements are	○ MET	○ Not MET
Minimum limit margin		
Maximum limit exceeding		

Remarks :

Begin of Test : April 11, 2005
Finish of Test : April 13, 2005

Prepared By

I.Y.Lee / EMC Engineer
