	Pls check below:					
	A master device is defined as a device operating in a mode in which it has the capability to transmit without receiving an					
	enabling signal. In this mode it is able to select a channel and initiate a network by sending enabling signals to other devices.   A client device is defined as a device operating in a mode in which the transmissions of the device are under control of the					
		in client mode is not able to		transmissions or th	e device are under control	or the
	master. A device	in chefft mode is not able to	initiate a network.			
	For client devices that have software configuration control to operate in different modes (active scanning in some and passive scanning in others) in different bands (devices with multiple equipment classes or those that operate on non-DFS frequencies) or modular devices which configure the modes of operations through software, the application must provide software and operations description on how the software and / or hardware is implemented to ensure that proper operations modes can not be modified by end user or an installer.  Apply, No Apply (If apply, pls help to provide explanation on it was implement, and how software was controlled)					
(6)	Please help to pr	rovide justification how devi	ce was restricted to operate	e in 5600-5650MHz i	n below.
