#### Glossary:

TSL	tissue simulating liquid
ConvF	sensitivity in TSL / NORM x,y,z
N/A	not applicable or not measured

#### Calibration is Performed According to the Following Standards:

- a) IEEE Std 1528-2003, "IEEE Recommended Practice for Determining the Peak Spatial-Averaged Specific Absorption Rate (SAR) in the Human Head from Wireless Communications Devices: Measurement Techniques", December 2003
- b) CENELEC EN 50361, "Basic standard for the measurement of Specific Absorption Rate related to human exposure to electromagnetic fields from mobile phones (300 MHz - 3 GHz), July 2001
- c) Federal Communications Commission Office of Engineering & Technology (FCC OET), "Evaluating Compliance with FCC Guidelines for Human Exposure to Radiofrequency Electromagnetic Fields; Additional Information for Evaluating Compliance of Mobile and Portable Devices with FCC Limits for Human Exposure to Radiofrequency Emissions", Supplement C (Edition 01-01) to Bulletin 65

#### Additional Documentation:

d) DASY4 System Handbook

#### Methods Applied and Interpretation of Parameters:

- Measurement Conditions: Further details are available from the Validation Report at the end
  of the certificate. All figures stated in the certificate are valid at the frequency indicated.
- Antenna Parameters with TSL: The dipole is mounted with the spacer to position its feed
  point exactly below the center marking of the flat phantom section, with the arms oriented
  parallel to the body axis.
- Feed Point Impedance and Return Loss: These parameters are measured with the dipole
  positioned under the liquid filled phantom. The impedance stated is transformed from the
  measurement at the SMA connector to the feed point. The Return Loss ensures low
  reflected power. No uncertainty required.
- Electrical Delay: One-way delay between the SMA connector and the antenna feed point. No uncertainty required.
- SAR measured: SAR measured at the stated antenna input power.
- SAR normalized: SAR as measured, normalized to an input power of 1 W at the antenna connector.
- SAR for nominal TSL parameters: The measured TSL parameters are used to calculate the nominal SAR result.

Certificate No: D1900V2-535\_Nov04

#### **Measurement Conditions**

DASY system configuration, as far as not given on page 1.

DASY4	V4.4
Advanced Extrapolation	
Modular Flat Phantom V4.9	
10 mm	with Spacer
dx, dy = 15 mm	
dx, dy, dz = 5 mm	
1900 MHz ± 1 MHz	
	Advanced Extrapolation Modular Flat Phantom V4.9 10 mm dx, dy = 15 mm dx, dy, dz = 5 mm

Head TSL parameters The following parameters and calculations were applied.

	Temperature	Permittivity	Conductivity
Nominal Head TSL parameters	22.0 °C	41.0	1.40 mho/m
Measured Head TSL parameters	(22.0 ± 0.2) °C	38.9 ± 6 %	1.45 mho/m ± 6 %
Head TSL temperature during test	(22.0 ± 0.2) °C		

#### SAR result with Head TSL

SAR averaged over 1 cm <sup>3</sup> (1 g) of Head TSL	condition	
SAR measured	250 mW input power	9.69 mW / g
SAR normalized	normalized to 1W	38.8 mW / g
SAR for nominal Head TSL parameters 1	normalized to 1W	37.5mW / g ± 17.0 % (k=2)
SAR averaged over 10 cm <sup>3</sup> (10 g) of Head TSL	condition	
SAR measured	250 mW input power	5.08 mW / g
SAR normalized	normalized to 1W	20.3 mW / g
SAR for nominal Head TSL parameters 1	normalized to 1W	19.7 mW / g ± 16.5 % (k=2)

<sup>1</sup> Correction to nominal TSL parameters according to d), chapter "SAR Sensitivities"

Page 4 of 9

#### Appendix

#### Antenna Parameters with Head TSL

Impedance, transformed to feed point	55.3 Ω + 6.6 jΩ	
Return Loss	- 22.0 dB	

#### Antenna Parameters with Body TSL

Impedance, transformed to feed point	49.8 Ω + 7.1 jΩ	
Return Loss	- 23.0 dB	

#### **General Antenna Parameters and Design**

Electrical Delay (one direction)	1.183 ns
----------------------------------	----------

After long term use with 100W radiated power, only a slight warming of the dipole near the feedpoint can be measured.

The dipole is made of standard semirigid coaxial cable. The center conductor of the feeding line is directly connected to the second arm of the dipole. The antenna is therefore short-circuited for DC-signals. No excessive force must be applied to the dipole arms, because they might bend or the soldered connections near the feedpoint may be damaged.

# DASY

speag

# **Dipole Validation Kit**

# Type: D1900V2

# Serial: 5d051

Manufactured: Calibrated: March 19, 2004 August 16, 2004

#### 1. Measurement Conditions

The measurements were performed in the quarter size flat phantom filled with **head simulating liquid** of the following electrical parameters at 1900 MHz:

Relative Dielectricity	39.4	± 5%
Conductivity	1.44 mho/m	± 5%

The DASY4 System with a dosimetric E-field probe ET3DV6 (SN:1507, Conversion factor 4.96 at 1900 MHz) was used for the measurements.

The dipole was mounted on the small tripod so that the dipole feedpoint was positioned below the center marking of the quarter size flat phantom and the dipole was oriented parallel to the body axis (the long side of the phantom). The standard measuring distance was <u>10mm</u> from dipole center to the solution surface. The included distance spacer was used during measurements for accurate distance positioning.

The coarse grid with a grid spacing of 15mm was aligned with the dipole. The 7x7x7 fine cube was chosen for cube integration.

The dipole input power (forward power) was  $250 \text{mW} \pm 3$  %. The results are normalized to 1W input power.

#### 2. SAR Measurement with DASY4 System

Standard SAR-measurements were performed according to the measurement conditions described in section 1. The results (see figure supplied) have been normalized to a dipole input power of 1W (forward power). The resulting averaged SAR-values measured with the dosimetric probe ET3DV6 SN:1507 and applying the <u>advanced extrapolation</u> are:

averaged over 1 cm<sup>3</sup> (1 g) of tissue:

**39.4 mW/g**  $\pm$  16.8 % (k=2)<sup>1</sup>

averaged over 10 cm<sup>3</sup> (10 g) of tissue:

**20.6 mW/g**  $\pm$  16.2 % (k=2)<sup>1</sup>

1 validation uncertainty

#### 3. Dipole Impedance and Return Loss

The impedance was measured at the SMA-connector with a network analyzer and numerically transformed to the dipole feedpoint. The transformation parameters from the SMA-connector to the dipole feedpoint are:

Electrical delay:	1.194 ns	(one direction)
Transmission factor:	0.982	(voltage transmission, one direction)

The dipole was positioned at the flat phantom sections according to section 1 and the distance spacer was in place during impedance measurements.

Feedpoint impedance at 1900 MHz:	$\operatorname{Re}\{Z\}=~54.0~\Omega$
	Im $\{Z\} = 4.0 \Omega$
Return Loss at 1900 MHz	-25.4 dB

#### 4. Measurement Conditions

The measurements were performed in the quarter size flat phantom filled with **body simulating tissue** of the following electrical parameters at 1900 MHz:

Relative Dielectricity	52.2	± 5%
Conductivity	1.58 mho/m	± 5%

The DASY4 System with a dosimetric E-field probe ET3DV6 (SN:1507, Conversion factor 4.57 at 1900 MHz) was used for the measurements.

The dipole was mounted on the small tripod so that the dipole feedpoint was positioned below the center marking of the quarter size flat phantom and the dipole was oriented parallel to the body axis (the long side of the phantom). The standard measuring distance was <u>10mm</u> from dipole center to the solution surface. The included distance spacer was used during measurements for accurate distance positioning.

The coarse grid with a grid spacing of 15mm was aligned with the dipole. The 7x7x7 fine cube was chosen for cube integration.

The dipole input power (forward power) was  $250 \text{mW} \pm 3$  %. The results are normalized to 1W input power.

#### 5. SAR Measurement with DASY4 System

Standard SAR-measurements were performed according to the measurement conditions described in section 4. The results (see figure supplied) have been normalized to a dipole input power of 1W (forward power). The resulting averaged SAR-values measured with the dosimetric probe ET3DV6 SN:1507and applying the <u>advanced extrapolation</u> are:

averaged over $1 \text{ cm}^3$ (1 g) of tissue:	<b>41.6 mW/g</b> $\pm$ 16.8 % (k=2) <sup>2</sup>
averaged over 10 cm <sup>3</sup> (10 g) of tissue:	<b>21.6 mW/g</b> $\pm$ 16.2 % (k=2) <sup>2</sup>

#### 6. Dipole Impedance and Return Loss

The dipole was positioned at the flat phantom sections according to section 4 and the distance spacer was in place during impedance measurements.

Feedpoint impedance at 1900 MHz:	$Re\{Z\} = 50.9 \Omega$
	Im $\{Z\} = 5.0 \Omega$
Return Loss at 1900 MHz	-27.2 dB

#### 7. Handling

Do not apply excessive force to the dipole arms, because they might bend. Bending of the dipole arms stresses the soldered connections near the feedpoint leading to a damage of the dipole.

#### 8. Design

The dipole is made of standard semirigid coaxial cable. The center conductor of the feeding line is directly connected to the second arm of the dipole. The antenna is therefore short-circuited for DC-signals.

Small end caps have been added to the dipole arms in order to improve matching when loaded according to the position as explained in Section 1. The SAR data are not affected by this change. The overall dipole length is still according to the Standard.

#### 9. Power Test

After long term use with 40W radiated power, only a slight warming of the dipole near the feedpoint can be measured.

<sup>2</sup> validation uncertainty

Accredited by the Swiss Federal Office of Metrology and Accreditation The Swiss Accreditation Service is one of the signatories to the EA Multilateral Agreement for the recognition of calibration certificates

Glossary:	
TSL	tissue simulating liquid
NORMx,y,z	sensitivity in free space
ConF	sensitivity in TSL / NORMx,y,z
DCP	diode compression point
Polarization o	o rotation around probe axis
Polarization 9	9 rotation around an axis that is in the plane normal to probe axis (al
	measurement center), i.e., 9 = 0 is normal to probe axis

#### Calibration is Performed According to the Following Standards:

- a) IEEE Std 1528-2003, "IEEE Recommended Practice for Determining the Peak Spatial-Averaged Specific Absorption Rate (SAR) in the Human Head from Wireless Communications Devices: Measurement Techniques", December 2003
- b) CENELEC EN 50361, "Basic standard for the measurement of Specific Absorption Rate related to human exposure to electromagnetic fields from mobile phones (300 MHz - 3 GHz), July 2001

#### Methods Applied and Interpretation of Parameters:

- NORMx,y,z: Assessed for E-field polarization 9 = 0 (f ≤ 900 MHz in TEM-cell; f > 1800 MHz: R22 waveguide). NORMx,y,z are only intermediate values, i.e., the uncertainties of NORMx,y,z does not effect the E<sup>2</sup>-field uncertainty inside TSL (see below *ConvF*).
- NORM(f)x, y, z = NORMx, y, z \* frequency\_response (see Frequency Response Chart). This
  linearization is implemented in DASY4 software versions later than 4.2. The uncertainty of
  the frequency response is included in the stated uncertainty of ConvF.
- DCPx, y, z: DCP are numerical linearization parameters assessed based on the data of power sweep (no uncertainty required). DCP does not depend on frequency nor media.
- ConvF and Boundary Effect Parameters: Assessed in flat phantom using E-field (or Temperature Transfer Standard for f ≤ 800 MHz) and inside waveguide using analytical field distributions based on power measurements for f > 800 MHz. The same setups are used for assessment of the parameters applied for boundary compensation (alpha, depth) of which typical uncertainty values are given. These parameters are used in DASY4 software to improve probe accuracy close to the boundary. The sensitivity in TSL corresponds to NORMx,y,z \* ConvF whereby the uncertainty corresponds to that given for ConvF. A frequency dependent ConvF is used in DASY version 4.4 and higher which allows extending the validity from ± 50 MHz to ± 100 MHz.
- Spherical isotropy (3D deviation from isotropy): in a field of low gradients realized using a
  flat phantom exposed by a patch antenna.
- Sensor Offset: The sensor offset corresponds to the offset of virtual measurement center from the probe tip (on probe axis). No tolerance required.

Certificate No: ET3-1669\_Jan05

January 13, 2005

The reported uncertainty of measurement is stated as the standard uncertainty of measurement multiplied by the coverage factor k=2, which for a normal distribution corresponds to a coverage probability of approximately 95%.

<sup>A</sup> The uncertainties of NormX,Y,Z do not affect the E<sup>2</sup>-field uncertainty inside TSL (see Page 8).

<sup>8</sup> Numerical linearization parameter: uncertainty not required.

# Probe EX3DV4 SN:3536

Manufactured: Last calibrated: April 30, 2004 August 27, 2004

### Calibrated for DASY Systems

(Note: non-compatible with DASY2 system!)

August 27, 2004

### DASY - Parameters of Probe: EX3DV4 SN:3536

#### Sensitivity in Free Space

#### Diode Compression<sup>A</sup>

NormX	0.42 μV/(V/m) <sup>2</sup>	DCP X	93	mV
NormY	0.45 μV/(V/m) <sup>2</sup>	DCP Y	93	mV
NormZ	0.38 μV/(V/m) <sup>2</sup>	DCP Z	93	mV

Sensitivity in Tissue Simulating Liquid (Conversion Factors)

Plese see Page 7.

#### **Boundary Effect**

Head	900 MHz	Typical SAR gradient: 5 % per mm

Sensor Center	r to Phantom Surface Distance	2.0 mm	3.0 mm
SAR <sub>be</sub> [%]	Without Correction Algorithm	4.2	1.7
SAR <sub>be</sub> [%]	With Correction Algorithm	0.0	0.0

#### Head

1750 MHz Typical SAR gradient: 10 % per mm

Sensor Cente	r to Phantom Surface Distance	2.0 mm	3.0 mm
SAR <sub>be</sub> [%]	Without Correction Algorithm	5.2	2.7
SAR <sub>be</sub> [%]	With Correction Algorithm	0.2	0.6

#### Sensor Offset

Probe Tip to Sensor Center

1.0 mm

The reported uncertainty of measurement is stated as the standard uncertainty of measurement multiplied by the coverage factor k=2, which for a normal distribution corresponds to a coverage probability of approximately 95%.

A numerical linearization parameter: uncertainty not required

### **Frequency Response of E-Field**

Receiving Pattern ( $\phi$ ),  $\theta$  = 0°

Probe Linearity Error < ± 0.2 dB

#### **Conversion Factor Assessment**

f [MHz]	Validity [MHz] <sup>B</sup>	Tissue	Permittivity	Conductivity	Alpha	Depth	ConvF Uncertainty
450	400-500	Head	43.5 ± 5%	0.87 ± 5%	0.10	1.84	9.77 ± 15.5% (k=2)
835	785-885	Head	41.5 ± 5%	0.90 ± 5%	0.63	0.67	9.88 ± 9.7% (k=2)
900	850-950	Head	41.5 ± 5%	0.97 ± 5%	0.26	1.07	9.49 ± 9.7% (k=2)
1750	1700-1800	Head	40.0 ± 5%	1.40 ± 5%	0.11	2.50	8.29 ± 9.7% (k=2)

5200	5150-5250	Head	36.0 ± 5%	4.66 ± 5%	0.49	1.80	5.27 ± 13.6% (k=2)
450	400-500	Body	56.7 ± 5%	0.94 ± 5%	0.11	1.79	9.31 ± 15.5% (k=2)
835	785-885	Body	55.2 ± 5%	0.97 ± 5%	0.24	1.29	9.78 ± 9.7% (k=2)
900	850-950	Body	55.0 ± 5%	1.05 ± 5%	0.28	1.08	9.42 ± 9.7% (k=2)
1750	1700-1800	Body	53.3 ± 5%	1.52 ± 5%	0.11	4.04	7.89 ± 9.7% (k=2)
1900	1850-1950	Body	53.3 ± 5%	1.52 ± 5%	0.12	4.63	7.54 ± 9.7% (k=2)
1950	1900-2000	Body	53.3 ± 5%	1.52 ± 5%	0.13	3.96	7.59 ± 9.7% (k=2)
2000	1950-2050	Body	53.3 ± 5%	1.52 ± 5%	0.14	4.10	7.26 ± 9.7% (k=2)
2450	2400-2500	Body	52.7 ± 5%	1.95 ± 5%	0.31	0.99	7.70 ± 9.7% (k=2)
5200	5150-5250	Body	49.0 ± 5%	5.30 ± 5%	0.50	1.90	4.84 ± 13.6% (k=2)

<sup>8</sup> The total standard uncertainty is calculated as root-sum-square of standard uncertainty of the Conversion Factor at calibration frequency and the standard uncertainty for the indicated frequency band.

August 27, 2004

Spherical Isotropy Error < ± 0.4 dB
