骨传导原理

我们听到的大部分声音,都是声波经过空气到达耳膜,然后声波使耳膜发生震动进而将声音传至内耳道;
另一种方式是,声波通过骨头震动直接传至内耳而不经耳膜,这也是人们听到自己声音的一种方式,这种声音的传播方式就是骨传导。

佩戴说明

将耳机挂在颈后,两侧的扬声器贴在面颊骨,调整佩戴的舒适度

Principles of bone conduction

Most of the sounds we hear is the result of sound waves passing through our eardrum to make the vibrate so that the sound waves can be conducted to the internal auditory ear canal;
Another way is that sound waves are transmitted directly conducted to the internal auditory ear canal through the vibration of the bone instead of eardrum. This is also a way for people to hear their own voice and this sound conduction is called bone conduction.

How to wear

Hang the headphne behind your neck with both speaker clinging to your cheekbones, after that, adjust it until you feel comfortable.
