3.3 Test Procedure

1. Connect the antenna: Place the device to be tested on the test transfer stand, the antenna is connected to the port of the network analyzer via the RF Cable, and confirmed that the connection is reliable.
2. Set test conditions: Enter the measurement frequency band in the test software according to the antenna working frequency band, and the measurement frequency point.
3. Measure antenna gain: The gain of the antenna to be tested is compared with the standard gain of the known antenna, so as to obtain the gain of DUT antenna.
4. Calculate antenna passive efficiency: Dividing the measured gain value by the antenna's directivity factor gives the antenna efficiency
5. Generate test report: Target the test results and analysis conclusions into test reports, and file and save.
