

FCC ID: DF6-WL306B

This submission is for a WLAN building bridge. This Bridge is intended to be installed outdoor by professional personnel and connect LAN of two buildings.

The radio output power can be set via software. This function is not accessible for the user it will be set by the manufacturer. Due to the high gain of the antenna and the maximum power the device will operate on channel 1-11 with its maximum power. For the channels 12 and 13 the power is lower in order to fulfill the high band edge compliance. The power settings are not accessible for the user.

The testing was done using the worst-case conditions of the antenna / power setting combination.
