

The device has RF output at VCR playback, DVD play and TV reception. At VCR playback and DVD play, the test was done with signal at normal operation because it operates with internal video signal. (Please refer to data page 64, 65, 68, 69, 74 and 75.) At TV reception, 25dBmV and 0dBmV signal was supplied to RF input from TV signal generator. (Please refer to data page 62, 63, 66, 67, 70 and 71.) This was not shown in the diagram in the test report. The diagram has been revised. Please refer to Figure 4. on Page 13 of the test report.

The test using 1Vp-p and 5Vp-p of video signal were not performed since the device does not operate with external video signal.

The output testing has been done in a modulated environment.
