- S-parameter : Return loss & Isolation**

Frequency (MHz)	BT
2400	-11.25
2450	-10.91
2500	-10.07

Unit:dB

Measurement data

❖ Radiation pattern : BT 2.45GHz

Measurement data

❖ Gain table: (In Free space) BT antenna

Frequency (MHz)	E-total (dBi)	Efficiency (%)
2400	1.27	42
2450	1.38	46
2500	0.64	40

❖ Gain table: (with metal plate) BT antenna

Frequency (MHz)	E-total (dBi)	Efficiency (%)
2400	3.38	42
2450	3.79	44
2500	3.5	40

Summary

◆ Return loss

BT antenna are under -10 dB.

◆ Efficiency

BT antenna has been improved which can achieve 40% .

◆ Radiation

When the metal plate is in the back of the DUT , BT antenna radiation will be impacted by metal plate . There is null point at the backside and antenna gain would be increase in the front side.

Test Procedure

- a) **Sub-divide the whole sphere surface into many 2x2 degree subsection.**
- b) **Measure the gain contributed from each antenna within each subsection position.**
- c) **Apply the KDB 662911 D01 correlated directional gain formula to calculate directional gain for each subsection.**
- d) **After all subsections have been evaluated, the largest calculated value among all positions evaluated is picked as the worst-case directional gain for the system and used in RF/EMC test report.**
