## TEST REPORT

Report No.A-006-04-C

Date: 21 April 2004

This test report is to certify that the tested device properly complies with the requirements of:

FCC Rules and Regulations Part 24 Personal Communications Services.

All the tests necessary to show compliance to the requirements were performed and these results met the specifications of requirement. The results of this report should not be construed to imply compliance of equipment other than that, which was tested. Unless the laboratory permission, this report should not be copied in part.

### 1. Applicant

Company Name : SANYO Electric Co., Ltd.  
Mailing Address : 1-1, Sanyo-cho, Daito-shi, Osaka, 574-8534 Japan

### 2. Identification of Tested Device

Type of Device : PHS Cell Station  
Type of Modulation : ☐: Narrowband PCS ☒: Broadband PCS  
Kind of Equipment Authorization : ☐: DoC ☒: Certification ☐: Verification  
FCC ID : AEZPBS-CS102  
Device Name : PHS Cell Station  
Trade Name : SANYO  
Model Number : PBS-CS102  
Serial Number : UTQ00001 ☐: Prototype ☒: Pre-production ☐: Production  
Date of Manufacture : March 2004

### 3. Test Items and Procedure

☒: RF Conducted Power Measurement  
☒: Antenna Conducted Spurious Emission Measurement  
☒: Transmit Power (EIRP) Measurement  
☒: Radiated Spurious (EIRP) Measurement  
☒: Occupied Bandwidth Measurement  
☒: Band Edge RF Conducted Emission Measurement  
☒: Frequency Stability Measurement  
☒: Radiated Emission Measurement  
☒: AC Power Line Conducted Emission Measurement

Above all tests were performed under: FCC Part 2, 24 and ANSI C63.4 – 2001

☒: without deviation, ☐: with deviation(details are found inside of this report)

### 4. Date of Test

Receipt of Test Sample : 22 March 2004  
Condition of Test Sample : ☒: Damage is not found on the set.  
☐: Damage is found on the set. (Details are described in this report)  
Test Completed on : 1 April 2004

Seichi Izumi  
General Manager/ Ikoma Testing Laboratory

## 0. LABORATORY ACCREDITATION AND MEASUREMENT UNCERTAINTY

### 0.1. Laboratory Accreditation

KEC is accredited by the National Voluntary Laboratory Accreditation Program (NVLAP) for the specific scope of accreditation under Lab Code: 200207-0.

When the test report concerns with the NVLAP accreditation test, the first page of the test report is signed by NVLAP Approved Signatory accompanied by the NVLAP logo.

The report must not be used by the client to claim product endorsement by NVLAP or any agency of the U.S. Government.

### 0.2. Measurement Uncertainty

The result of a measurement is only an approximation or estimate of the value of a specific quantity. And thus the measured is complete only when a statement of uncertainty is given.

KEC quotes Measurement Uncertainty (U)

- of  $\pm 3 \times 10^{-9}$  for Frequency Stability Measurement
- of  $\pm 0.7$  dB for Peak Output Power Measurement
- of  $\pm 0.7$  dB for Band Edge RF Conducted Measurement
- of  $\pm 0.7$  dB for Spurious RF Conducted Emission Measurement
- of  $\pm 4.9$  dB for Radiated Emissions
- of  $\pm 2.2$  dB for Conducted Emissions

## 1. CERTIFICATION OF THE COMPLIANCE

This test report is to certify that the tested device properly complies with the requirements of FCC Rules Part 24 and Part 15 Subpart B unintentional.

## 2. GENERAL INFORMATION

### 2.1. Product Description

The SANYO Model No. PBS-CS102 (referred as EUT in this report) is a PHS Cell Station.

#### (1) Technical Specifications

|                       |                                                                    |
|-----------------------|--------------------------------------------------------------------|
| • radio channel       | : 1C7T                                                             |
| • rated output power  | : 500 mW (Average)                                                 |
| • Frequency Range     | : 1880.15 – 1905.55 MHz                                            |
| • Carrier Separation  | : 300 kHz                                                          |
| • Occupied Bandwidth  | : 288 kHz                                                          |
| • Modulation method   | : $\pi/4$ shift QPSK                                               |
| • Baud rate           | : 384 kbps                                                         |
| • Transmission system | : Omni system                                                      |
| • Receiving system    | : Adaptive array system                                            |
| • Communication port  | : I interface (2B+D, 2B, 2B, 2B)                                   |
| • External Antenna    | : Co – Liner array antenna<br>(Impedance 50 $\Omega$ , Gain 10dBi) |

#### (2) Used Oscillating Frequency

|                                               |                       |
|-----------------------------------------------|-----------------------|
| • System Clock                                | : 19.2 MHz            |
| • 1st IF                                      | : 12 MHz              |
| • 1st IFLO                                    | : 9.6 MHz             |
| • 2nd IF                                      | : 10.8 MHz            |
| • 2nd IFLO                                    | : 233.15 MHz          |
| • 3rd IF                                      | : 243.95 MHz          |
| • RF LO                                       | : 1636.2 ~ 1665.6 MHz |
| • CPU Clock<br>(Central control part)         | : 4.9152 MHz          |
| • CPU Clock<br>(Wireless-radio-control part)  | : 33 MHz              |
| • DSP Clock<br>(Radio signal processing part) | : 50 MHz              |

#### (3) Provided Terminals

|                     |                                            |
|---------------------|--------------------------------------------|
| • ANT               | : Antenna port (4port, connector : type N) |
| • AC Input          | : for AC power input                       |
| • GPS connector     | : for GPS Antenna                          |
| • L1~4              | : ISDN port                                |
| • Cascade connector | : USB terminal                             |
| • Login connector   | : RS-232C, inside of EUT                   |

|                        |                        |
|------------------------|------------------------|
| (4) Rated Power Supply | : AC 85V~286V, 50/60Hz |
|------------------------|------------------------|

## 2.2. Description for Equipment Authorization

(1) Type of device : ☒ Intentional Raidators

(2) Reference Rule and Specification : FCC Rule Part 24 Subpart E, Broadband PCS

(3) Kind of Equipment Authorization : ☐ DoC ☒ Certification ☐ Verification

(4) Highest Frequency used in the Device : 1880.15~1909.85MHz

(5) Upper Frequency of Radiated Emission Measurement Range

: ☐ 1000 MHz ☐ 2000 MHz ☐ 5000 MHz  
☒ Tenth harmonics of the highest fundamental frequency

## 2.3. Test Facility

All tests described in this report were performed by:

Name: KANSAI ELECTRONIC INDUSTRY DEVELOPMENT CENTER (KEC)  
 IKOMA TESTING LABORATORY

Open Area Test Site ☐ No.1 ☐ No.4  
 Anechoic Chamber ☒ No.1 ☐ No.3  
 Shielded Room ☐ No.1 ☐ No.2 ☒ No.4 ☐ No.5

Address: 12128, Takayama-cho Ikoma-city, Nara, 630-0101 Japan

These test facilities have been filed with the FCC under the criteria of ANSI C63.4-2001. The KEC has been accredited by the NVLAP (Lab. Code: 200207-0) based on ISO/IEC 17025. Also the laboratory has been authorized by TUV Product Service (GER) and TUV Rheinland (GER) based on their criteria for testing laboratory (ISO/IEC 17025).

### 3. TESTED SYSTEM

#### 3.1. Test Mode

The following operation modes were used under the test.

Op-mode 1 : Transmitting at 1880.15 MHz (ch. 206), ANT1 to 4 with modulation  
 Op-mode 2 : Transmitting at 1894.85 MHz (ch. 255), ANT 1 to 4 with modulation  
 Op-mode 3 : Transmitting at 1905.55 MHz (ch. 49), ANT 1 to 4 with modulation  
 Op-mode 4 : Receiving at ch. 49  
 Op-mode 5 : Receiving at ch. 255  
 Op-mode 6 : Receiving at ch. 206

|                                                 |                                    |
|-------------------------------------------------|------------------------------------|
| a) RF Conducted Power                           | : Op-mode 1, 2, 3                  |
| b) Antenna Conducted Spurious measurement       | : Op-mode 1, 2, 3                  |
| c) Transmit Power (EIRP) measurement            | : Op-mode 1, 2, 3                  |
| d) Radiated Spurious (EIRP) measurement         | : Op-mode 1, 2, 3                  |
| e) Occupied Bandwidth measurement               | : Op-mode 1, 2, 3                  |
| f) Band Edge RF Conducted measurement           | : Op-mode 1, 3                     |
| g) Frequency Stability measurement              | : Op-mode 1, 2, 3 (ANTENNA 1 only) |
| h) Radiated Emission measurement                | : Op-mode 1, 2, 3, 4, 5, 6         |
| i) AC Power Line Conducted Emission measurement | : Op-mode 1, 2, 3, 4, 5, 6         |

[Note]

In Radiated Emission measurement and AC Power Line Conducted Emission measurements, the data the emission were checked above 6 operation modes. As a results, the data that produce the maximum emission were reported at each frequency.

#### 3.2. Characterization and condition of EUT System

☒ : normal , ☐ : not normal (that is )

### 3.3. Test Configuration

- RF Conducted Power Measurement
- Occupied Bandwidth Measurement
- Bandedge RF Conducted Emission Measurement

- Antenna Conducted Spurious Measurement

(1) Frequency Range 30 MHz – 5.8 GHz

(2) Frequency Range 5.8 GHz – 20 GHz

(\*) : Calibrated 3.5  $\phi$  type coaxial cable

- Continued -

- Transmit Power (EIRP) measurement
- Radiated Spurious (EIRP) measurement
- Radiated Emission measurement

- Continued -

[Note]

(\*) : Center of the array antenna height (See page 12).

- Continued -

• AC Power Line Conducted Emission Measurement

### 3.4. Block Diagram of EUT System

**[Note]**

- (1) Transmit Power, Radiated spurious, Radiated Emission and AC Power Line Conducted Emission measurement were performed above block diagram.  
In other test items, (B) to (E) above figure were removed and connecting the spectrum analyzer by using both of an attenuator and calibrated coaxial cables.
- (2) See 3.6 List of EUT System and 3.7 List of Cables.

3.5. Test Arrangement on Radiated Spurious Emission Measurement

## 3.6. List of EUT System

| No | Device Name<br>(Interface) | Model Number<br>(Serial Number) | FCC ID<br>(Trade Name)         | Note                                  | Remark |

## 5. ANTENNA CONDUCTED SPURIOUS EMISSION MEASUREMENT (§24.238)

### 5.1. Test Procedure

- |     |                                                                                                                                    |
|-----|------------------------------------------------------------------------------------------------------------------------------------|
| (1) | Connect the EUT RF output port to the spectrum analyzer via calibrated coaxial cable and suitable attenuator (if necessary).       |
| (2) | Activates the EUT System and executes the software prepared for test, if necessary.                                                |
| (3) | The Spectrums are scanned from the lowest generated frequency of EUT up to the 10th harmonics by using the spectrum analyzer (*1). |

## [Note]

(1) No other spurious emission found above noise level.

(2) (\*) : Correction factor is included the cable loss and band eliminated filter insertion loss, pre-amplifier gain and attenuator loss.

## [Calculation method (\*2) ]

Spurious RF Emission ( dBm ) = Meter Reading ( dBm ) + Correction Factor (dB)

Calculation of the Limit.

ex) ANT.1 RF Conducted Power : 6.5[W] = 38.1 [dBm]

$$\text{Limit Level} = 38.1 \text{ [dBm]} - (43 + 10\log_{10}(6.5))$$

$$= -13.0 \text{ [dBm]}$$

Deviation From Margin for Limit [dB] = Limit level (dBm) – Spurious RF Emission (dBm)

## [Test Condition]

EUT operation : Op-mode 1, 2, 3, 4

Output Ant. : 1 to 4

## [ Environment ]

Temperature 23°C

Humidity 32%

## [ Tested Date / Tester ]

26 March 2004

6.1. Test Procedure

|                                                                                                                                                                                                                                                                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                |          |                      |         |                 |         |            |        |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------|----------|----------------------|---------|-----------------|---------|------------|--------|
| (1)                                                                                                                                                                                                                                                                                      | Place the transmitter to be tested (EUT) on the turntable.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                |          |                      |         |                 |         |            |        |
| (2)                                                                                                                                                                                                                                                                                      | Measurements shall be made from the lowest radio frequency generated in the equipment to the tenth harmonic of the carrier.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                |          |                      |         |                 |         |            |        |
| (3)                                                                                                                                                                                                                                                                                      | For each spurious frequency, raise and lower the test antenna from 1m to 4m to obtain a maximum reading on the spectrum analyzer (*1) with the test antenna at horizontal polarity.<br>Then the turntable should be rotated 360° to determine the maximum reading. Repeat this procedure to obtain the highest possible reading. Record this maximum reading.                                                                                                                                                                                                                                              |                |          |                      |         |                 |         |            |        |
| (4)                                                                                                                                                                                                                                                                                      | Repeat step (3) for each spurious frequency with the test antenna polarized vertically.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                |          |                      |         |                 |         |            |        |
| (5)                                                                                                                                                                                                                                                                                      | Remove the transmitter and replace it with a substitution antenna (the antenna should be half-wavelength for each frequency involved). The center of the substitution antenna should be approximately at the same location as the center of the transmitter.<br>At the lower frequencies, where the substitution antenna is very long, this will be impossible to achieve when the antenna is polarized vertically.<br>In such case the lower end of the antenna should be 0.3m above the ground.                                                                                                          |                |          |                      |         |                 |         |            |        |
| (6)                                                                                                                                                                                                                                                                                      | Feed the substitution antenna at the transmitter end with a signal generator connected to the antenna by means of a non-radiating cable.<br>With the antennas at both ends horizontally polarized and with the signal generator tuned to a particular spurious frequency, raise and lower the test antenna to obtain a maximum reading at the spectrum analyzer. Adjust the level of the signal generator output until the previously recorded maximum reading for this set of conditions is obtained.<br>This should be done carefully repeating the adjustment of the test antenna and generator output. |                |          |                      |         |                 |         |            |        |
| (7)                                                                                                                                                                                                                                                                                      | Repeat step (6) with both antennas vertically polarized for each spurious frequency.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                |          |                      |         |                 |         |            |        |

## 7. RADIATED SPURIOUS (E. I. R. P) MEASUREMENT (§ 24.238)

### 7.1. Test Procedure

|                                                                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                |          |                      |         |                 |              |            |        |
|-----------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------|----------|----------------------|---------|-----------------|--------------|------------|--------|
| <p>(1)</p> <p>(2)</p> <p>(3)</p> <p>(4)</p> <p>(5)</p> <p>(6)</p> <p>(7)</p> <p>(8)</p> | <p>Place the transmitter to be tested (EUT) on the turntable.</p> <p>Measurements shall be made from the lowest radio frequency generated in the equipment to the tenth harmonic of the carrier.</p> <p>For each spurious frequency, raise and lower the test antenna from 1m to 4m to obtain a maximum reading on the spectrum analyzer (*1) with the test antenna at horizontal polarity.<br/>Then the turntable should be rotated 360° to determine the maximum reading. Repeat this procedure to obtain the highest possible reading. Record this maximum reading.</p> <p>Repeat step (3) for each spurious frequency with the test antenna polarized vertically.</p> <p>Remove the transmitter and replace it with a substitution antenna (the antenna should be half-wavelength for each frequency involved). The center of the substitution antenna should be approximately at the same location as the center of the transmitter.<br/>At the lower frequencies, where the substitution antenna is very long, this will be impossible to achieve when the antenna is polarized vertically.<br/>In such case the lower end of the antenna should be 0.3m above the ground.</p> <p>Feed the substitution antenna at the transmitter end with a signal generator connected to the antenna by means of a non-radiating cable.<br/>With the antennas at both ends horizontally polarized and with the signal generator tuned to a particular spurious frequency, raise and lower the test antenna to obtain a maximum reading at the spectrum analyzer. Adjust the level of the signal generator output until the previously recorded maximum reading for this set of conditions is obtained.<br/>This should be done carefully repeating the adjustment of the test antenna and generator output.</p> <p>Repeat step (6) with both antennas vertically polarized for each spurious frequency.</p> <p>The levels record in step (8) are the absolute levels of radiated spurious emissions in dBm. The radiated spurious emissions in dB can be calculated by the following:</p> |                |          |                      |         |                 |              |            |        |

[Note]

(1) (\*) Couple Factor is included both of coupling factor and insertion of the using coupling device.

(2) No other spurious emission found above noise level.

[Calculation method]

EIRP [dBm] : Meter Reading [dBm] + Couple Factor [dB] + Tx. Antenna Gain [dBi] – Cable loss [dB]

Calculation of the limit

ex) ANT.1 EIRP at 1880.15 MHz, 47.9 [W] (= 46.8 [dBm] )

Limit level = 46.8 [dBm] – (43+10log<sub>10</sub> (60.3))  
= -13.0 [dBm]

[Test Condition]

EUT operation : Op-mode 1, 2, 3, 4

Output Ant. : 1 to 4

[ Environment ]

Temperature 20°C

Humidity 38%

[Tested Date / Tester]

22 ~ 25 March 2004

## 8. OCCUPIED BANDWIDTH MEASUREMENT (§ 2.1049, §24.238)

### 8.1. Test Procedure

|        |                                                                                                                             |
|--------|-----------------------------------------------------------------------------------------------------------------------------|
| (1)    | Connect the EUT RF output port to spectrum analyzer via calibrated coaxial cable and suitable attenuator (if necessary).    |
| (2)    | Activates the EUT System and execute the software prepared for test, if necessary.                                          |
| (3)    | To find out the maximum emission condition, the transmitting data rate of EUT is set to maximum data rate.                  |
| (4)    | The Spectrums are scanned and allow the trace stabilized.                                                                   |
| (5)    | The both side of 26dB down value from peak power were measured by using delta-maker function of the spectrum analyzer (*1). |
| (6)    | Above measurement were performed under low-band frequency, mid-band frequency and high band frequency.                      |
| [Note] |                                                                                                                             |
| (*1)   | Spectrum Analyzer Set Up Conditions                                                                                         |
|        | Frequency Span : 1 MHz                                                                                                      |
|        | Resolution bandwidth : 10 kHz                                                                                               |
|        | Video bandwidth : more than RBW                                                                                             |
|        | Sweep : Auto                                                                                                                |
|        | Detector function : Peak                                                                                                    |
|        | Trace Mode : Max Hold                                                                                                       |

## 9. BAND EDGE RF CONDUCTED EMISSION MEASUREMENT (§ 24.238)

### 9.1. Test Procedure

- (1) Connect the EUT RF output port to the spectrum analyzer via calibrated coaxial cable and suitable attenuator (if necessary).
- (2) Activates the EUT System and executes the software prepared for test, if necessary.
- (3) To find out the maximum emission condition, the transmitting data rate of EUT is set to maximum data rate.
- (4) The spectrum are scanned.
- (5) The emission at the band edge or the highest modulation product outside of band were measured by using the marker function of spectrum analyzer (\*1).
- (6) The peak of the in-band emission were measured by using the marker to peak function of spectrum analyzer.
- (7) Above measurement were repeated at other side band edge.

[Note]

(\*1) Spectrum Analyzer Set Up Conditions

|                      |                                                                                     |

## 10. FREQUENCY STABILITY MEASUREMENT (§ 2.1055, § 24.235)

## 10.1. Test Procedure

- (a) Frequency Stability Measurement versus Temperature  
The EUT was placed in an environmental chamber and was tested in the range from -30 to +50 degrees Celsius. The EUT was stabilized at each temperature. The power (120VAC) supplied was applied to the transmitter and allowed to stabilize for 10 minutes after startup. This procedure was repeated from -30 to +50 degrees Celsius at the interval of 10 degrees.
- (b) Frequency Stability Measurement versus Temperature  
The EUT was placed in an environmental chamber and was tested at the temperature of +20 degrees Celsius. The EUT was stabilized at the temperature. The power (120VAC), the power (102VAC, 85%) and the power (138VAC, 115%) was applied to the EUT allowed to stabilize for 10 minutes. The transmitting frequency was measured at startup and 2 minutes, 5 minutes and 10 minutes after startup.

## 10.2. Test Results

[Note]

- (1) Antenna Factor includes the cable loss.
- (2) Above 1GHz, antenna factor includes both of the cable loss and pre-amplifier gain.

[Calculation method at Peak detector]

Maximum Field Strength (dB $\mu$ V/m)

= Meter Reading (at maximum level of Horizontal or Vertical) (dB $\mu$ V) + Antenna Factor (dB/m)

[EUT Condition]

EUT operation : Op mode 1~6

[Environment]

Temperature: 20°C

Humidity: 34%

[Tested Date/ Tester]

## 12. AC POWER LINE CONDUCTED EMISSION MEASUREMENT (§ 15.247 c2)

### 12.1. Test Procedure

|        |                                                                                                                                                                                                                                                                                                      |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| (1)    | Configure the EUT System in accordance with ANSI C63.4-2001 section 7.<br><input checked="" type="checkbox"/> : without deviation, <input type="checkbox"/> : with deviation (details are found below)<br>See also the block diagram and the photographs of EUT System configuration in this report. |
| (2)    | Connect the EUT's AC power cord to one Line Impedance Stabilization Network (LISN).                                                                                                                                                                                                                  |
| (3)    | Any other power cord of other equipment is connected to a LISN different from the LISN used for the EUT.                                                                                                                                                                                             |
| (4)    | Warm up the EUT System.                                                                                                                                                                                                                                                                              |
| (5)    | Activate the EUT System and run the software prepared for the test, if necessary.                                                                                                                                                                                                                    |
| (6)    | Connect the spectrum analyzer (*1) to the measuring port of the LISN for the EUT, using a calibrated coaxial cable.                                                                                                                                                                                  |
| (7)    | To find out an EUT System condition, which produces the maximum emission, the configuration of EUT System, the position of the cables, and the operation mode, are changed under normal usage of the EUT.                                                                                            |
| (8)    | The spectrums are scanned from 150 kHz to 30 MHz and collect the six highest emissions minimum on the spectrum analyzer relative to the limits in the whole range.                                                                                                                                   |
| (9)    | The test receiver (*2) is connected to the LISN for the EUT, and the six highest emissions minimum recorded above are measured.                                                                                                                                                                      |
| [Note] |                                                                                                                                                                                                                                                                                                      |
|        |                                                                                                                                                                                                                                                                                                      |
| (*1)   | Spectrum Analyzer Set Up Conditions<br>Frequency range : 150 kHz - 30 MHz<br>Resolution bandwidth : 10 kHz<br>Video bandwidth : 1 MHz<br>Detector function : Peak mode                                                                                                                               |

| 10.690                        | 0.5                   | 28.1                 | 25.3                 | 28.6                                 | 60.0                     | 50.0                      | 31.4                       |
| 10.762                        | 0.5                   | 27.1                 | 24.1                 | 27.6                                 | 60.0                     | 50.0                      | 32.4                       |

Measurement with the Average Detector

| Measured Frequency<br>( MHz ) | LISN Factor<br>( dB ) | Meter Reading        |                      | Maximum RF Voltage<br>( dB $\mu$ V ) | Limits                    | Margin for Limit<br>( dB ) |
|-------------------------------|-----------------------|----------------------|----------------------|--------------------------------------|---------------------------|----------------------------|
|                               |                       | Va<br>( dB $\mu$ V ) | Vb<br>( dB $\mu$ V ) |                                      | Average<br>( dB $\mu$ V ) |                            |
| 0.290                         | 0.2                   | 38.0                 | 41.6                 | 41.8                                 | 50.5                      | 8.7                        |

[Calculation method]

Maximum RF Voltage (dB $\mu$ V)

= Meter Reading ( at maximum level of Va or Vb ) + LISN Factor (dB)

[Note]

(1) LISN Correction Factor includes the cable loss.

(2) If the measurement value with the quasi-peak detector meets the average limits, the measurement with the average detector is omitted.

[EUT Condition]

EUT operation : Op mode 1~6

[Environment]

Temperature: 22°C

Humidity: 40%

[Tested Date/ Tester]

25 March 2004

Signature

Ikuya Minematsu

|                | N/A | : Not Applicable.                                 |

The overall program of calibration and verification of equipment is designed and operated so as to ensure that measurements made by KEC are traceable to national standards of measurement or equivalent abroad.
