**Summary**

Tests for compliance with FCC Regulations, Part 15, Subpart C, and for compliance with Industry Canada RSS-210, were performed on Johnson Controls (Universal Garage Door Opener) Transmitter, Model LH EVIC. In the tests the transmitters were trained to three duty factors (30%, 50%, and 80%) and of three frequencies (288 MHz, 310 MHz, and 418 MHz).

In testing performed during December 8-12 and 21, 1999, in the worst case of the all combinations tested, the device tested in the worst case met the allowed limits for radiated emissions by 1.4 dB at the fundamental (p. 7) and by 2.8 dB at the harmonics (p. 11). Besides harmonics and presence of short "blips" when locking the VCO to the required frequency, there were no other significant spurious emissions found.

The conductive emission tests do not apply, since the device is powered from a 12V automobile source.

## 1. Introduction

Johnson Controls transmitter, Model LH EVIC, was tested for compliance with FCC Regulations, Part 15, adopted under Docket 87-389, April 18, 1989, and with Industry Canada RSS-210, Issue 2, dated February 14, 1998. The tests were performed at the University of Michigan Radiation Laboratory Willow Run Test Range following the procedures described in ANSI C63.4-1992 "Methods of Measurement of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the Range of 9 kHz to 40 GHz". The Site description and attenuation characteristics of the Open Site facility are on file with FCC Laboratory, Columbia, Maryland. (FCC file 31040/SIT) and with Industry Canada, Ottawa, ON (File Ref. No: IC2057).

## 2. Test Procedure and Equipment Used

The test equipment commonly used in our facility is listed in Table 2.1 below. The second column identifies the specific equipment used in these tests. The HP 8593E spectrum analyzer is used for primary amplitude and frequency reference.

Table 2.1. Test Equipment.

### **3. Configuration and Identification of Device Under Test**

The DUT is a 7.5 x 5 x 1.5 inch OEM device that goes in automobile console and is powered by 12 VDC. It contains a learning garage door opener transmitter, a compass, a trip computer and temperature display. It differs from a standard Garage Door Opener (GDO) in that it does not have a fixed frequency and code, but rather learns and repeats the frequency and code from another GDO, with capability to repeat up to three GDOs. The DUT uses a 20.0 MHz crystal frequency reference and operates over 288 to 418 MHz. The forbidden bands are "blocked out" in software. Depending on the frequency and the duty factor of the GDO that is being learned, the DUT attenuates the emissions in software using predetermined attenuation settings.

The DUT was designed and manufactured by Johnson Controls, Inc., Automotive Systems Group, 915 E. 32nd Street, Holland, MI 49423. It is identified as:

**Johnson Controls Homelink Transmitter**  
**Model: LH EVIC**  
**SN: FCCLHEVIC**  
**FCC ID: CB2LHEVICH3**  
**CANADA: to be provided by IC**

The same unit was used in all the tests. It was programmed for continuous periodic pulse modulation for duty factors and carrier frequencies as required for the tests

#### **3.1 EMI Relevant Modifications**

There were no modifications made to the DUT by this laboratory after submission for final testing. However, during the development of the product, JCI used the University of Michigan facilities to optimize the firmware or the device.

## 4. Emission Limits

### 4.1 Radiated Emission Limits

The DUT tested falls under the category of an Intentional Radiators and the Digital Devices. For FCC, it is subject to Part 15, Subpart C, (Section 15.231), Subpart B, (Section 15.109), and Subpart A, (Section 15.33). For Industry Canada it is subject to RSS-210, (Sections 6.1 and 6.3). The applicable testing frequencies with corresponding emission limits are given in Tables 4.1 and 4.2 below. As a digital device, the DUT is considered as a Class B device.

Table 4.1. Radiated Emission Limits (FCC: 15.231(b), 15.205(a); IC: RSS-210; 6.1, 6.3) Transmitter.

| Frequency<br>(MHz)                                                              | Fundamental<br>Ave. $E_{lim}$ (3m) |                 | Spurious**<br>Ave. $E_{lim}$ (3m) |                 |
|---------------------------------------------------------------------------------|------------------------------------|-----------------|-----------------------------------|-----------------|
|                                                                                 | ( $\mu$ V/m)                       | dB ( $\mu$ V/m) | ( $\mu$ V/m)                      | dB ( $\mu$ V/m) |
| 260.0-470.0                                                                     | 3750-12500*                        |                 | 375-1250                          |                 |
| 322-335.4<br>399.9-410<br>608-614                                               | Restricted<br>Bands                |                 | 200                               | 46.0            |
| 960-1240<br>1300-1427<br>1435-1626.5<br>1660-1710<br>1718.9-1722.2<br>2200-2300 | Restricted<br>Bands                |                 | 500                               | 54.0            |

\* Linear interpolation, formula:  $E = -7083 + 41.67 * f$  (MHz)

\*\* Measure up to tenth harmonic; 120 kHz BW up to 1 GHz, 1 MHz BW above 1 GHz

Table 4.2. Radiated Emission Limits (FCC: 15.33, 15.35, 15.109; IC: RSS-210, 6.2.2(r)). (Digital Class B)

| Freq. (MHz) | $E_{lim}$ (3m) $\mu$ V/m | $E_{lim}$ dB( $\mu$ V/m) |
|-------------|--------------------------|--------------------------|
| 30-88       | 100                      | 40.0                     |
| 88-216      | 150                      | 43.5                     |
| 216-960     | 200                      | 46.0                     |
| 960-2000    | 500                      | 54.0                     |

Note: Average readings apply above 1000 MHz (1 MHz BW)  
Quasi-Peak readings apply to 1000 MHz (120 kHz BW)

#### 4.2 Conductive Emission Limits

The conductive emission limits and tests do not apply here, since the DUT is powered from automotive 12 VDC source.

### 5. Radiated Emission Tests and Results

#### 5.1 Anechonic Chamber Measurements

To familiarize with the radiated emission behavior of the DUT, the DUT was first studied and measured in a shielded anechonic chamber. In the chamber there is a set-up similar to that of an outdoor 3-meter site, with a turntable, an antenna mast, and a ground plane. Instrumentation includes spectrum analyzers and other equipment as needed. In testing for radiated emissions, the transmitter modified for continuous emissions was used. It was placed in a styrofoam block to facilitate its orientation on any of its three major axis, i. e., flat down, on its side, or on its end.

In the chamber we studied and recorded all the emissions using a bicone antenna up to 300 MHz and a ridged horn antenna above 200 MHz. The measurements made in the chamber below 1 GHz are used for pre-test evaluation only. The measurements made above 1 GHz are used in pre-test evaluation and in the final compliance assessment. We note that for the horn antenna, the antenna pattern is more directive and hence the measurement is essentially that of free space (no ground reflection). Consequently it is not essential to measure the DUT for both antenna polarizations, as long as the DUT is measured on all three of its major axis. In the chamber we also recorded the spectrum and modulation characteristics of the carrier. These data are presented in subsequent sections. We also note that in scanning from 30 MHz to 4.2 GHz using bicone and the ridge horn antennas, there were no other significant spurious emissions observed.

#### 5.2 Outdoor Measurements

After the chamber measurements, the emissions were re-measured on the outdoor 3-meter site at fundamental and harmonics up to 1 GHz using tuned dipoles and/or the high frequency bicone.

Photographs in Appendix shows the DUT on the open in site table (OATS).

#### 5.3 Computations and Results

To convert the dBm measured on the spectrum analyzer to dB( $\mu$ V/m), we use expression

$$E_3(\text{dB}\mu\text{V/m}) = 107 + P_R + K_A - K_G + K_E$$

where

|       |   |                                                         |
|-------|---|---------------------------------------------------------|
| $P_R$ | = | power recorded on spectrum analyzer, dB, measured at 3m |
| $K_A$ | = | antenna factor, dB/m                                    |
| $K_G$ | = | pre-amplifier gain, including cable loss, dB            |
| $K_E$ | = | pulse operation correction factor, dB (see Sec. 6.1)    |

When presenting the data, at each frequency the highest measured emission under all of the possible orientations is given. Computations and results are given in Tables 5.1 through 5.3. There we see that the DUT meets the limit by 1.4 dB (p. 7).

### 6. Other Measurements and Computations

#### 6.1 Correction For Pulse Operation

As agreed previous between FCC and Prince (now JCI), the DUT was taught signals of 30, 50, and 80% duty factors at 310 MHz. The repeated wave shape were measured and from those the duty factors were obtained. Figures 6.1(a) through 6.1(c) show the measured wave shapes from which the duty factors were computed. They are:

30% duty factor The modulation consists of 0.562 ms wide pulses of period 1.85 ms. Thus,

$$K_E = 0.562/1.85 = 0.304 \text{ or } -10.3 \text{ dB.}$$

50% duty factor The modulation consists of 0.9625 ms wide pulses of period 1.85 ms. Thus,

$$K_E = 0.9625/1.85 = 0.520 \text{ or } -5.7 \text{ dB.}$$

80% duty factor The modulation consists of 1.5125 ms wide pulses of period 1.85 ms. Thus,

$$K_E = 1.5125/1.85 = 0.818 \text{ or } -1.8 \text{ dB.}$$

## 6.2 Emission Spectrum

Using the ridge-horn antenna and DUT placed in its aperture, emission spectrum was recorded and is shown in Figure 6.2.

## 6.3 Bandwidth of the Emission Spectrum

The measured spectrum of the signal is shown in Figure 6.3. The measurements were made at 310 MHz for 30, 50, and 80% duty factor modulations. At 310 MHz the allowed (-20 dB, 0.25%) bandwidth is 775 kHz. From the plots we see that, in the worst case, the -20 dB bandwidth is 150.0 kHz for 30% duty factor (Fig. 6.3(a)).

## 6.4 Effect of Supply Voltage Variation

The DUT has been designed to be powered from automotive 12 V battery. For this test, a laboratory variable power supply was used and relative radiated field was measured at the fundamental, as the voltage was varied from 6 to 18 volts. The emission variation is shown in Figure 6.4.

## 6.5 Input Voltage and Current (310 MHz, CW)

$$\text{Supply Voltage} = 12.8 \text{ VDC}$$

$$\text{Current} = 594.0 \text{ mADC}$$

## 6.6 Verification of Non-operation in Restricted Bands

The DUT has been designed to learn and operate over 288 to 418 MHz frequency range. It also has been programmed to stay out of the Restricted Bands. In the operating range of the DUT, these bands are 240.0 - 285.0 MHz, 322.0 - 335.4 MHz, and 399.9 - 410.0 MHz.

Using a 500 Hz 50% duty factor modulated carrier from a signal generator, the DUT was "taught" frequencies from 240.0 to 440.0 MHz. It repeated frequencies from 288.0 MHz to 321.0 MHz, from 336.5 MHz to 399.0 MHz, and from 411.0 MHz to 420.0 MHz. In any case, no frequency was learned in the Restricted Bands. (Also there were no spurious emissions in the Restricted Bands.)

Meas. 12/8-12/99, 1/4/00; U of Mich.

Figure 6.1(a). Transmissions modulation characteristics: (top) pulse width, (bottom) pulse period. (310 MHz, 30% duty factor)

Figure 6.1(b). Transmissions modulation characteristics: (top) pulse width, (bottom) pulse period. (310 MHz, 50% duty factor)

Figure 6.1(c). Transmissions modulation characteristics: (top) pulse width, (bottom) pulse period. (310 MHz, 80% duty factor)

Figure 6.2(a). Emission spectrum of the DUT (288 MHz, 50% duty factor)  
 The amplitudes are only indicative (not calibrated).

Figure 6.2(b). Emission spectrum of the DUT (310 MHz, 50% duty factor).  
 The amplitudes are only indicative (not calibrated).

Figure 6.2(c). Emission spectrum of the DUT (418 MHz, 50% duty factor).  
The amplitudes are only indicative (not calibrated).

Figure 6.3(a). Measured bandwidth of the DUT.  
(Pulsed mode, 310 MHz, 30% duty factor).

Figure 6.3(b). Measured bandwidth of the DUT.  
(Pulsed mode, 310 MHz, 50% duty factor).

Figure 6.3(c). Measured bandwidth of the DUT.  
(Pulsed mode, 310 MHz, 80% duty factor).

Figure 6.4. Relative emission vs. supply voltage. (310 MHz, CW)
