Mobile device exposure for simultaneous transmission operations: the sum of the MPE ratios for all simultaneously transmitting antennas incorporated in a host device is \leq 1.0

Intertek Total Quality. Assured. TEST REPORT

2.2 Assessment Results

Power density (S) is calculated according to the formula:

 $S = P / (4\pi R^2)$

Where S = power density in mW/cm^2

P = Radiated transmit power in mW

G = numeric gain of transmit antenna

R = distance (cm)

As we can see from the test report 240600137SHA-001, 240600137SHA-002, 240600137SHA-003:

The calculations in the table below use the highest gain of antenna for client EUT. These calculations represent worst case in terms of the exposure levels.

| Mode | Frequency band | Max Power | Antenna Gain | R | S | Limits |
|-----------|-------------------|--------------|-----------------|------|----------|----------|
| | (MHz) | dBm | dBi | (cm) | (mW/cm2) | (mW/cm2) |
| Bluetooth | 2402 -2480 | 2.13 | 5.41 | 20 | 0.0011 | 1 |
| WIFI 2.4G | 2412-2462 | 16.44 | 4.62 | 20 | 0.0254 | 1 |
| WIFI 5G | 5180 – 5825 | 13.06 | 5.41 | 20 | 0.0140 | 1 |

Note: 1 mW/cm2 from 1.310 Table 1

The sum of the MPE ratios for all simultaneously transmitting:

Bluetooth and 2.4G WIFI can simultaneous transmitting, so the maximum rate of MPE is, 0.0011/1+0.0254/1=0.0265< 1.0

Bluetooth and 5G WIFI can simultaneous transmitting, so the maximum rate of MPE is, 0.0011/1+0.0140/1=0.0151<1.0

For the device can support simultaneous transmission, according to 447498 D01 General RF Exposure Guidance v06,

Appendix I

Definition below must be outlined in the User Manual:

To satisfy FCC RF exposure requirements, a separation distance of 20 cm or more should be maintained between the antenna of this device and persons during device operation. To ensure compliance, operations at closer than this distance is not recommended.
