Tune up procedure

Tune up procedure is:

1. Set Digital Repeater at maximum gain
2. Tune the input level to receive maximum permitted output power (9.55 watt).
3. Store this level in comparator reference table.
4. If output level exceeds this reference ALC automatically reduces gain of Digital Repeater to reach maximum permitted output power.

ALC level is only factory preset.

The factory engineers confirm that output power can't be more than 9.55 watt.

Customer can adjust GAIN to reach ALC output level.

Customers are not permitted to adjust ALC level.
