15.214(d) - THIS DEVICE COMPLIES WITH THE SECURITY CODE REQUIREMENTS  
OF 15.214(d)(1)(2) AND (3) BY MEANS OF THE FOLLOWING:

THIS DEVICE HAS 65536 SECURITY CODES. THE CPU CONTROLS THE RF FREQUENCY  
CHANNEL. AND THE ASIC CONTROLS ADPCM CODEC AND AUDIO SIGNAL SWITCHING  
ALSO SET UP THE SPREADING CODE. BEFORE THE COMMUNICATION LINK IS  
ESTABLISHED, THE DEVICE SEARCHES VACANT RF CHANNELS AND THEN TRANSMITS  
RF SIGNAL AT THE VACANT CHANNEL. THE CPU GENERATES A RANDOM SECURITY  
CODE OUT OF 65536 CODES WHICH CAN PROTECT PRIVACY.

#### TEST PROCEDURE

GENERAL: This report shall NOT be reproduced except in full without the written approval of TIMCO ENGINEERING, INC. Shielded interface cables were used in all cases except for cables connecting to the telephone line and the power cords. A test program was run which simulated a normal data transmission on a network.

POWER LINE CONDUCTED INTERFERENCE: The procedure used was ANSI STANDARD C63.4-1992 using a 50uH LISN. Both lines were observed. The bandwidth of the spectrum analyzer was 10kHz with an appropriate sweep speed. The ambient temperature of the UUT was 74°F with a humidity of 44%.

BANDWIDTH 6.0dB: The measurements were made with the spectrum analyzer's resolution bandwidth(RBW)=100KHz and the video bandwidth(VBW)=300KHz and the span set as shown on plot.

FCC ID : AA04303513

TEST PROCEDURES CONTINUED

POWER OUTPUT: The RF power output was measured at the antenna feed point by removing the permanent antenna and connecting the UUT to a peak power meter, HP Model No. 8900C.

ANTENNA CONDUCTED EMISSIONS: The RBW=100KHz, VBW > or = RBW and the spectrum was scanned from 30MHz to the 10th Harmonic of the fundamental.

RADIATION INTERFERENCE: The test procedure used was ANSI STANDARD C63.4-1992 using a HEWLETT PACKARD spectrum analyzer with a preselector. The bandwidth(RBW) of the spectrum analyzer was 100kHz up to 1GHz and 1.0MHz above 1GHz with an appropriate sweep speed. The VBW above 1.0GHz was = 1.0MHz. The analyzer was calibrated in dB above a microvolt at the output of the antenna. The ambient temperature of the UUT was 74°F with a humidity of 44%.

15.247(d) POWER SPECTRAL DENSITY. The peak within the pass band was located with a RBW OF 3KHz and a span of 2.0 MHz, slightly greater than the 6dB bandwidth, then span was centered on the display and the span is reduced to 900KHz and the sweep time set to 500 seconds. Since the spectral line spacing could not be resolved, the spectral density was measured using the noise power density and adding the correction of 35dB. This response is then plotted.

15.247(e): PROCESSING GAIN, This gain is supplied by the manufacturer of the UUT.

2.1033(b)(4)

ANTENNA AND GROUND SYSTEM:

This unit uses a short, inductively loaded, antenna element for the base unit and the handset. The antenna is permanently attached to the unit and no provision is made for connection to an external antenna.

No ground connection is provided. The only ground in use is the ground plane on the printed circuit board.

APPLICANT: RADIOSHACK CORPORATION

FCCID: AA04303513

REPORT #: T:\CUS\R\RADSHACK\527BU0\527BU0RPT.doc

PAGE #: 3

APPLICANT: RADIOSHACK CORPORATION  
FCC ID: AA04303513  
NAME OF TEST: POWER LINE CONDUCTED INTERFERENCE  
RULES PART NUMBER: 15.207  
MINIMUM REQUIREMENTS:      FREQUENCY              LEVEL  
   MHz                      dBuV  
   0.450-30              48 dBuV or 250 uV  
TEST PROCEDURE:      ANSI STANDARD C63.4-1992

THE HIGHEST EMISSION READ FOR LINE 1 WAS 21.4 uV @ 570KHz.

THE HIGHEST EMISSION READ FOR LINE 2 WAS 11.7 uV @ 570KHz.

THE GRAPHS IN EXHIBITS 9-10 REPRESENT THE EMISSIONS READ FOR  
POWERLINE CONDUCTED FOR THIS DEVICE.

TEST RESULTS: Both lines were observed with the UUT transmitting.  
The measurements indicate that the unit DOES appear to meet the FCC  
requirements for this class of equipment.

FCC ID:                     AA04303513

NAME OF TEST:               OCCUPIED BANDWIDTH

RULES PART NUMBER:   15.247

15.247(a)(2)

6dB bandwidth shall be at least 500 kHz. The 6dB points for both the base is 1.530 MHz and handset is 1.510 MHz. As shown in the accompanying plots. The bandwidth was measured at three places in the band and the narrowest is reported below.

Base 6dB Bandwidth = 1.530 MHz

Handset 6 dB Bandwidth = 1.510 MHz

15.247(B) PEAK POWER OUTPUT

The maximum peak output power shall not exceed 1 watt (30 dBm). If directional transmitting antennas with a gain of more than 6 dBi are used, the power shall be reduced by the amount in dB that the directional gain of the antenna exceeds 6 dBi.

Both the base and handset have a maximum power output of less than +30 dBm. Power was measured by disconnecting the antennas and measuring across a 50 ohm load as recommended by the manufacturer using a HP peak power meter Model 8900C. The antennas are non directional and do not exceed 6 dBi gain. The power output was measured at three places in the band highest is reported below.

POWER OUTPUT - LIMIT +30 dBm

BASE PEAK POWER OUTPUT = +12 dBm or 16 mWatts

HANDSET PEAK POWER OUTPUT = +12 dBm or 16 mWatts

 FCC ID:                      AA04303513  
 NAME OF TEST:                RADIATED SPURIOUS EMISSIONS - HANDSET  
 RULES PART NUMBER:   15.247(c)

REQUIREMENTS:           Emissions that fall in the restricted bands  
                               (15.205). These emissions must be less than  
                               or equal to 500 uV/m (54 dBuV/m). Spurious  
                               not in a restricted band must be 20dBc.

Manufacturer supplied a CW test mode for radiated and power output  
 measurements and included a peak to duty cycle/DSSS mode correction  
 factor of -6.02 dB which was applied to the following values.  
 Even without the correction factor the unit complies with current rules.

TEST DATA:

5520.60	5.35	1.56	34.71	-6.02	35.60	79.98	44.38	H

SAMPLE CALCULATION:  $FSdBuV/m = MR(dBuV) + ACFdB + COAX + C.F.$

METHOD OF MEASUREMENT: The procedure used was ANSI STANDARD C63.4-1992. When an emission was found, the table was rotated to produce the maximum signal strength. The antenna was placed in both the horizontal and vertical planes and the worse case emissions were reported. The spectrum was scanned from 30 MHz to 10 GHz using a Hewlett Packard Model 8566B Spectrum Analyzer, Hewlett Packard Model 85685A Preselector, Hewlett Packard Model 85650A Quasi-Peak Adaptor, and an appropriate antenna. Low loss coax was used above 1 GHz. Measurements were made at Timco Engineering, Inc. 849 NW State Road 45 Newberry, Fl.

TEST RESULTS: The unit DOES meet the FCC requirements.

PERFORMED BY: Joseph Scoglio

REPORT #: T:\CUS\R\RADSHACK\527BU0\527BU0RPT.doc

PAGE #: 9

APPLICANT:                   RADIOSHACK CORPORATION

FCC ID:                     AA04303513

NAME OF TEST:               POWER SPECTRAL DENSITY

RULES PART NUMBER:   15.247(d)

REQUIREMENTS:           The power spectral density averaged  
                          over any 1 second interval shall not be  
                          greater than 8 dBm in any 3 kHz bandwidth  
                          within these bands.

TEST DATA:

The spectrum line spacing could not be resolved so the noise power  
density was measured;

Measurement Method:

Starting from the settings that were used for the 6 dB bandwidth the  
peak signal was located and the span was reduced and the sweep time  
increased in a manner to maintain calibration and to keep the peak  
emission in the display, then once the sweep time reached 500seconds  
at 2.00 MHz span the spectrum analyzer was put into the noise power  
mode and the plots made.

A value of -26.2 dBm was calculated for the handset.

A value of -24.2 dBm was calculated for the base.
