I, the undersigned, hereby declare that the equipment tested and referenced in this report conforms to the identified standard(s) as described in this test report. No modifications were made to the equipment during testing in order to achieve compliance with these standards. Furthermore, there was no deviation from, additions to, or exclusions from, the applicable parts of FCC Part 2, FCC Part 15 Industry Canada RSS-Gen and ANSI C63.4.

1 General Information

1.1 Scope

This measurement report is prepared on behalf of VEGA Grieshaber KG in accordance with the applicable Federal Communications Commission and Industry Canada rules and regulations.

The Equipment Under Test (EUT) was the Level Probing Radar Model PS60K, Level Probing Radar, with PS60HK electronics, FCC ID: O6QPS60XK2, IC: 3892A-PS60XK2 tested with five different antennas.

1.2 Test Facility

The open area test site and conducted measurement facility used to collect the radiated data is located on the parking lot of Rhein Tech Laboratories, Inc., 360 Herndon Parkway, Suite 1400, Herndon, Virginia 20170. This site has been fully described in a report submitted to and approved by the Federal Communications Commission to perform AC line conducted and radiated emissions testing.

1.3 Modifications

None.

2 Tested System Details

The test sample was received on May 2, 2015. Listed below are the identifiers and descriptions of all equipment, cables, and internal devices used with the EUT for this testing, as applicable.

Table 2-1: Equipment under Test (EUT)

Figure 2-1: Configuration of Tested System

2.2 Test Distance

The final radiated emissions tests were performed at a 3-meter horizontal distance from the edge of the radar to the test antenna. The EUT was also investigated at closer test distances in order to discern any emissions.

3 Modulated Bandwidth – ANSI C63.10 6.9, FCC 14-2 (15.256(f)(1))RSS-Gen 4.6

3.1 Modulated Bandwidth Test Procedure - FCC 14-2 (15.256(f)(1))RSS-Gen 4.6.1

The minimum 10 dB bandwidth was measured using a 50-ohm spectrum analyzer with the resolution bandwidth set at 1 MHz and the video bandwidth set at 3 MHz. The spectrum analyzer's display markers were set to -10 dB using max hold until the spectrum was filled and a plot taken.

3.2 Limits

(f) The fundamental bandwidth of an LPR emission is defined as the width of the signal between two points, one below and one above the center frequency, outside of which all emissions are attenuated by at least 10 dB relative to the maximum transmitter output power when measured in an equivalent resolution bandwidth.

(1) The minimum fundamental emission bandwidth shall be 50 MHz for LPR operation under the provisions of this section.

3.3 Modulated Bandwidth Test Data

Table 3-1: 10 dB Modulated Bandwidth - 15.256(f)(1)

Model	10 dB Bandwidth (MHz)	Minimum Limit (MHz)	Margin (MHz)

---------------------------------------	--	--

4 Radiated Emissions – ANSI C63.10 6.3, FCC 15.256(g)(3); RSS-Gen 4.8

4.1 Radiated Fundamental Emissions Test Procedure – FCC 15.256(g)(3); RSS-Gen 4.8

Radiated emissions of the fundamental were tested by “bore sighting” the main-beam emissions to produce the maximum realizable antenna coupling. The EUT was also checked in all three orthogonal planes. Measurement was based on an average detector for -14 dBm/1 MHz power density limit and peak detector for 26 dBm/50 MHz limit. Limits are -14 dBm/MHz and 26 dBm/50 MHz bandwidth (corrected to 20 MHz). Since these limits are power density, no pulse desensitization correction factor is required. Both were also measured finding the maximum amplitude at 3 meters and switching from 1 MHz to 20 MHz resolution bandwidths.

Limits: The EIRP limits for LPR operations in the bands authorized by this rule section are provided in the following table. These emission limits are based on bore sight measurements (i.e., measurements performed within the main beam of the LPR antenna).

Frequency Band of Operation (GHz)	Average Emission Limit (EIRP in dBm measured in 1 MHz)	Peak Emission Limit (EIRP in dBm measured in 50 MHz)
5.925-7.250	-33	7
24.05-29.00	-14	26
75-85	-3	34

4.2 Radiated Fundamental Emissions Test Data

Radiated measurements are converted from dBuV/m to dBm using the following equation from KDB 890966 6 b:

For radiated emission measurements

$$\text{EIRP (dBm)} = \text{field strength (dB}\mu\text{V/m)} - 104.8 + 20 \text{ Log D}$$

where:

D is the measurement distance

All power averaging (RMS) emission levels are to be measured utilizing a 1 MHz resolution bandwidth with a one millisecond dwell time over each 1 MHz segment. The frequency span of the analyzer should equal the number of sampling bins times 1 MHz and the sweep rate of the analyzer should equal the number of sampling bins times one millisecond. The video bandwidth of the measurement instrument shall not be less than the resolution bandwidth and trace averaging shall not be employed. The RMS average emission measurement is to be repeated over multiple sweeps with the analyzer set for maximum hold until the amplitude stabilizes. The peak emission measurement is to be repeated over multiple sweeps with the analyzer set for maximum hold until the amplitude stabilizes.

NOTE: Number of sampling BINS used = 1501

4.2.1 Test Configuration #1

Table 4-1: Radiated Fundamental Emissions (EIRP in 1 MHz, Average Detector) (TC #1)

Frequency (GHz)	Average Spectrum Analyzer Level (dBuV)	Antenna Correction Factor (dB/m)	Corrected Average Measurement (dBuV/m)	Converted to dBm	Limit (dBm)	Margin (dB)
26.0	28.9	40.6	69.5	-25.7	-14.0	-11.7

Table 4-2: Radiated Fundamental Emissions (EIRP in 50 MHz, Peak Detector) (TC #1)

Frequency (GHz)	Peak EIRP Measured (dBuV)	Site Correction Factor (dB/m) + 8 dB*	Corrected Peak Measurement (dBuV/m)	Converted to dBm	Limit (dBm)	Margin (dB)
25.9	49.9	48.6	98.5	3.3	26.0	-22.7

*Per FCC 15.256(g)(2)(ii): The Rhode & Schwarz FSU 50 spectrum analyzer used a maximum video bandwidth resolution of 20 MHz, which is less than the required 50 MHz RBW, a lower RBW of 20 MHz was adjusted to the limit using $20 \log(\text{RBW}/50)$ dB. The resolution bandwidth used is 20 MHz, therefore $20 \log(20/50) = 8$ dB increase of the fundamental to adjust towards the 50 MHz EIRP BW requirement.

*NOTE: Per FCC 15.256(g)(2)(ii): The Rhode & Schwarz FSU 50 spectrum analyzer used a maximum video bandwidth resolution of 20 MHz less than the required 50 MHz RBW, a lower RBW of 20 MHz was adjusted to the limit using $20 \log(\text{RBW}/50)$ dB. The resolution bandwidth used is 20 MHz, therefore $20 \log(20/50) = 8$ dB increase of the fundamental to adjust towards the 50 MHz EIRP BW requirement.

4.3 Radiated Emissions – ANSI C63.10 6.3, FCC 14-2 (15.256(h)(k)); RSS-Gen 4.9

4.4 Radiated Emissions Harmonics/Spurious Test Procedure - FCC 14-2 (15.256(h)(k)); RSS-Gen 4.9

No radiated emissions of the harmonics were found to be measured; noise floor data was taken and corrected to three meters. The EUT was checked in the three orthogonal planes with the receive antenna in both polarities. A resolution bandwidth of 100 kHz was used for frequencies less than 1000 MHz, and a resolution bandwidth of 1 MHz was used for frequencies greater than or equal to 1000 MHz.

Limit: Unwanted Emissions from LPR devices shall not exceed the general emission limit in §15.209 of this chapter.

4.5 Radiated Emissions Harmonics/Spurious Test Data

No radiated harmonics were found to be measured or unintentional emissions above 1 GHz. The following plots are provided as reference.

The plots were taken with the measuring antenna abutted to the transmit antenna, showing no indication or detectable frequencies, this reduces signal to noise ratio as a distance of 1 mm corrected to 3 m is $20 \log(0.001/3) = -69.5$ dB. The emissions from the EUT were investigated at 0.1 m and 3 m to ensure no indication of detectable emissions.

Test Engineer	Signature	Dates of Test

5 Frequency Stability ANSI C63.10 6.8, FCC 14-2 (15.256(f)(2)); RSS-Gen 4.7

5.1 Frequency Stability Test Procedure - FCC 14-2 (15.256(f)(2)); RSS-Gen 4.7

The carrier frequency stability is the ability of the transmitter to maintain an assigned carrier frequency.

The EUT was evaluated over the temperature range -30°C to +55°C.

The temperature was initially set to -30°C and a 1-hour period was observed for stabilization of the EUT. The frequency stability was measured within one minute after application of primary power to the transmitter. The temperature was raised at intervals of 10 degrees centigrade through the range. A ½-hour period was observed to stabilize the EUT at each measurement step and the frequency stability was measured within one minute after application of primary power to the transmitter. Additionally, the power supply voltage of the EUT was varied +/-15% nominal input voltage, +15% of minimum voltage and -15% of maximum voltage.

5.2 FCC 15.256(f)(2) Limit

LPR devices operating under this section must confine their fundamental emission bandwidth within the 5.925-7.250 GHz, 24.05-29.00 GHz, and 75-85 GHz bands under all conditions of operation.

5.3 Temperature-Voltage Frequency Stability Test Data

Plot 5-1: Frequency Stability – Standard Electronics

To determine if the bandwidth of the signal remains within the band 24.05 GHz – 29 GHz, the lowest frequency generated, 25.162067372 GHz (at -55°C, 11.04VDC), and the highest frequency generated, 26.242708398 GHz (at -20°C, 9.6 VDC), are compared to the bandwidth of the signal as measured, 1971.153 MHz.

Half the bandwidth to determine the edge of the frequency is subtracted from the lowest frequency generated, and added to the highest frequency generated.

$$\frac{1}{2} \text{ bandwidth} = 1971.153 \text{ MHz} / 2 = 985.5765 \text{ MHz.}$$

Lowest frequency generated 25.162 GHz - 986 MHz = 24.176 GHz, which is within the band 24.05 - 29 GHz (passing with margin 24.05 - 24.176 = -126 MHz)

Highest frequency generated 26.242708398 GHz + 986 MHz = 27.22871 GHz, which is within the band 24.05 - 29 GHz (passing with margin 27.22871 – 29 = -1.77129 GHz)

Results: The EUT is compliant.

6 AC Conducted Emissions - FCC Rules and Regulations ANSI C63.10 6.2, Part 15.207; RSS-Gen 7.2.4

6.1 Test Methodology for Conducted Line Emissions Measurements – Part 15.207; RSS-Gen 7.2.4

The power line conducted emission measurements were performed in a Series 81 type shielded enclosure manufactured by Rayproof. The EUT was placed on a wooden table. Power was fed to the EUT through a 50-ohm/50 μ Henry Line Impedance Stabilization Network (LISN). The EUT LISN was fed power through an AC filter box on the outside of the shielded enclosure. The filter box and EUT LISN housing are bonded to the ground plane of the shielded enclosure. A second LISN, the peripheral LISN, provides isolation for the EUT's auxiliary equipment. This peripheral LISN was also fed AC power.

The spectrum analyzer was connected to the AC line through an isolation transformer. The 50-ohm output of the EUT LISN was connected to the spectrum analyzer input through a Solar 100 kHz high-pass filter. The filter is used to prevent overload of the spectrum analyzer from noise below 100 kHz. Conducted emission levels were measured on each current-carrying line with the spectrum analyzer operating in the CISPR quasi-peak mode (or peak mode if applicable). The analyzer's 6 dB bandwidth was set to 9 kHz. Video filter less than 10 times the resolution bandwidth is not used. Average measurements are performed in linear mode using a 10 kHz resolution bandwidth, a 1 Hz video bandwidth, by increasing the sweep time in order to obtain a calibrated measurement. The emission spectrum was scanned from 150 kHz to 30 MHz. The highest emission amplitudes relative to the appropriate limits were measured and have been recorded.

6.2 Conducted Line Emissions Test Procedure

Conducted emissions were performed on the EUT using an off-the-shelf power supply. The general conducted limit under Part 15.207 was applied. The emissions were scanned between 150 kHz to 30 MHz on the neutral and phase conductors.

7 Conclusion

The data in this measurement report shows that the Vega Grieshaber KG Model PS60K, FCC ID: O6QPS60XK2, IC:3892A-PS60XK2, complies with the applicable requirements of Parts 2 and 15 of the FCC rules and regulations.
