

Response to Fcc questions Re: BCR-MRB-CELL
Oct:28/99

**-Justification for 2 ch. intermodulation tests in leu of 3 ch.
intermodulation tests.**

On Thursday July 8/99 our client called Frank Copperich at the Fcc. A follow up e-mail was initiated by me on July 9/99(see attached e-mail copy). Howard Gianopulos explained to Frank that we wished to use 2 Generators. Was this allowed? And how do we measure, and report the data? Frank explained that 2 sig. was allowed provided the 2 sig were placed inside the band at in the vicinity of one edges of the band to produce inband and out of band products. Only emissions out side of the block as per 24.238 were to be considered. Next, the 2 signals should be moved to the other end of the band and repeat the process. This was done. And only worst case emissions were included in the report.
