GENERAL INFORMATION

Product Description for Equipment Under Test (EUT)

The *VCom Inc.* 's product, FCC ID: *OPPTR850* or the "EUT" as referred to in this report is a 850MHz Subscriber Transceiver, which measures approximately 178mm L x 127mm W x 25mm H.

The EUT operates at the frequency of 824~849MHz, Maximum output power of 0.271W (640Ksym/sec), 0.282W (1280Ksym/sec) & 0.279W (2580Ksym/sec), frequency tolerance 2.5ppm and emission designator 7K63G1D (640Ksym/sec) & 1M48G1D (1280Ksym/sec) & 3M07G1D (2580Ksym/sec).

* The test data gathered are from typical production sample, serial number: FA3J01 provided by the manufacturer.

Objective

This type approval report is prepared on behalf of *VCom Inc.* in accordance with Part 2, Subpart J, Part 22 Subpart H of the Federal Communication Commissions rules.

The objective is to determine compliance with FCC rules for output power, modulation characteristic, occupied bandwidth, spurious emission at antenna terminal, field strength of spurious radiation, frequency stability, and conducted and radiated margin.

Related Submittal(s)/Grant(s)

No Related Submittals

Test Methodology

All tests and measurements indicated in this document were performed in accordance with the Code of Federal Regulations Title 47 Part 2, Sub-part J as well as the following parts:

Part 15 Subpart B – Unintentional Radiators Part 22 Subpart H - Public Mobile Services

Applicable Standards: TIA EIA 137-A, TIA EIA 603-B, ANSI 63.4-2003, American National Standard for Methods of Measurement of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the range of 9 kHz to 40 GHz.

All radiated and conducted emissions measurement was performed at Bay Area Compliance Laboratory, Corp. The radiated testing was performed at an antenna-to-EUT distance of 3 meters.

Test Facility

The Open Area Test site used by Bay Area Compliance Laboratory Corporation to collect radiated and conducted emission measurement data is located in the back parking lot of the building at 230 Commercial Street, Sunnyvale, California, USA.

Test site at Bay Area Compliance Laboratory Corporation has been fully described in reports submitted to the Federal Communication Commission (FCC) and Voluntary Control Council for Interference (VCCI). The details of these reports has been found to be in compliance with the requirements of Section 2.948 of the FCC Rules on February 11 and December 10, 1997 and Article 8 of the VCCI regulations on December 25, 1997. The facility also complies with the radiated and AC line conducted test site criteria set forth in ANSI C63.4-2003.

The Federal Communications Commission and Voluntary Control Council for Interference has the reports on file and is listed under FCC file 31040/SIT 1300F2 and VCCI Registration No.: C-1298 and R-1234. The test site has been approved by the FCC and VCCI for public use and is listed in the FCC Public Access Link (PAL) database.

Additionally, BACL is a National Institute of Standards and Technology (NIST) accredited laboratory, under the National Voluntary Laboratory Accredited Program (Lab Code 200167-0). The current scope of accreditations can be found at <u>http://ts.nist.gov/ts/htdocs/210/214/scopes/2001670.htm</u>

SYSTEM TEST CONFIGURATION

Justification

The EUT was configured for testing according to TIA/EIA-603.

The final qualification test was performed with the EUT operating at normal mode.

Block Diagram

Please refer to Exhibit D.

Equipment Modifications

No modifications were made to the EUT.

§15.107 - CONDUCTED EMISSIONS

Measurement Uncertainty

All measurements involve certain levels of uncertainties, especially in field of EMC. The factors contributing to uncertainties are spectrum analyzer, cable loss, and LISN.

Based on NIS 81, The Treatment of Uncertainty in EMC Measurements, the best estimate of the uncertainty of any conducted emissions measurement at BACL is ± 2.4 dB.

EUT Setup

The measurement was performed in the shielded room, using the same setup per ANSI C63.4-2003 measurement procedure. The specification used was FCC 15 Class B limits.

The spacing between the peripherals was 10 cm.

The external I/O cables were draped along the test table and bundled as required.

The power adapter of the EUT was connected to 120VAC/60Hz power source.

Spectrum Analyzer Setup

The spectrum analyzer was set to investigate the spectrum from 150 kHz to 30MHz.

Test Equipment List and Details

Manufacturer	Description	Model	Serial Number	Cal. Date
Rohde & Schwarz	Artificial LISN	ESH2-Z5	871884/039	2004-08-16
Rohde & Schwarz	EMI Test Receiver	ESCS30	100176	2004-09-15

* **Statement of Traceability: BACL Corp.** attests that all calibrations have been performed per the NVLAP requirements, traceable to the NIST.

Test Procedure

During the conducted emission test, the power cord of the EUT was connected to the mains outlet of the LISN-1, the power cord signal generator was connected to the LISN-2.

Maximizing procedure was performed on the six (6) highest emissions of the EUT.

All data was recorded in the quasi-peak and average detection mode. Qusi-Peak readings are distinguished with an "QP". Average readings are distinguished with an "Ave".

Test Results Summary

According to the recorded data, <u>the EUT complies with the FCC</u> Conducted limits for a Class B device, with the worst margin reading of:

-10.3 dB at 2.06 MHz in the Line conductor mode.

Conducted Emissions Test Data

Environmental Conditions

§2.1053 – SPURIOUS RADIATED EMISSIONS

Applicable Standard

Requirements: CFR 47, § 2.1053.

Test Procedure

The transmitter was placed on a wooden turntable, and it was transmitting into a non-radiating load which was also placed on the turntable.

The measurement antenna was placed at a distance of 3 meters from the EUT. During the tests, the antenna height and polarization as well as EUT azimuth were varied in order to identify the maximum level of emissions from the EUT. The test was performed by placing the EUT on 3-orthogonal axis.

The frequency range up to tenth harmonic of the fundamental frequency was investigated.

Remove the EUT and replace it with substitution antenna. A signal generator was connected to the substitution antenna by a non-radiating cable. The absolute levels of the spurious emissions were measured by the substitution.

Spurious emissions in dB = 10 lg (TXpwr in Watts/0.001) - the absolute level

Spurious attenuation limit in $dB = 43 + 10 \text{ Log}_{10}$ (power out in Watts)

§1.1310 and §2.1091 - RF EXPOSURE

According to §1.1307, systems operating under the provisions of this section shall be operated in a manner that ensures that the public is not exposed to radio frequency energy level in excess of the Commission's guidelines.

According to §1.1310 and §2.1091 RF exposure is calculated.

Limits for General Population/Uncontrolled Exposure

Frequency	Electric Field	Magnetic Field	Power Density	Averaging Time
Range (MHz)	Strength (V/m)	Strength (A/m)	(mW/cm^2)	(minute)
	Limits for Gen	eral Population/Unco	ntrolled Exposure	
0.3-1.34	614	1.63	*(100)	30
1.34-30	824/f	2.19/f	$*(180/f^2)$	30
30-300	27.5	0.073	0.2	30
300-1500	/	/	f/1500	30
1500-100,000	/	/	1.0	30

f = frequency in MHz

* = Plane-wave equivalent power density

MPE Prediction

Predication of MPE limit at a given distance

Equation from page 18 of OET Bulletin 65, Edition 97-01

 $S = PG/4\pi R^2$

Where: S = power density

- P = power input to antenna
- G = power gain of the antenna in the direction of interest relative to an isotropic radiator

 $R = \hat{d}istance$ to the center of radiation of the antenna

Maximum peak output power at antenna input terminal: <u>24.5 (dBm)</u> Maximum peak output power at antenna input terminal: <u>282 (mW)</u> Prediction distance: <u>150 (cm)</u> Predication frequency: <u>850 (MHz)</u> Antenna Gain (typical): <u>10 (dBi)</u> antenna gain: <u>10 (numeric)</u> Power density at predication frequency at 150 cm: <u>0.01 (mW/cm²)</u>

MPE limit for uncontrolled exposure at prediction frequency: 0.57 (mW/cm²)

Test Result

The power density level at 150 cm is 0.01 mW/cm², which is below the uncontrolled exposure limit of 0.57 mW/cm² at 850 MHz.

§2.1046, §22.913(a) – RF OUTPUT POWER

Applicable Standard

According to FCC §2.1046 and §22.913 (a), the ERP of mobile transmitters and auxiliary test transmitters must not exceed 7 watts.

Test Procedure

The RF output of the transmitter was connected to the input of the spectrum analyzer through sufficient attenuation.

§2.1049, §22.917(b) - OCCUPIED BANDWIDTH

Applicable Standard

Requirements: CFR 47, Section 2.1049 and 22.917(b).

Test Procedure

The RF output of the transmitter was connected to the input of the spectrum analyzer through sufficient attenuation.

The resolution bandwidth of the spectrum analyzer was set at 30 KHz and the 26 dB bandwidth was recorded.

Test Equipment List and Details

Manufacturer	Description	Model	Serial Number	Cal. Date

§2.1051, §22.917 - SPURIOUS EMISSIONS AT ANTENNA TERMINALS

Applicable Standard

Requirements: CFR 47, § 2.1051, § 22.917.

The spectrum was to be investigated to the tenth harmonics of the highest fundamental frequency as specified in § 2.1057.

Test Procedure

The RF output of the transceiver was connected to a spectrum analyzer through appropriate attenuation. The resolution bandwidth of the spectrum analyzer was set at 100 kHz. Sufficient scans were taken to show any out of band emissions up to 10^{th} harmonic.

§2.1055 (a), §2.1055 (d), §22.355 - FREQUENCY STABILITY

Applicable Standard

Requirements: FCC § 2.1055 (a), § 2.1055 (d) & following:

According to §22.355, the carrier frequency of each transmitter in the Public Mobile Services must be maintained within the tolerances given in Table C-1 of this section.

 Table C-1_Frequency Tolerance for Transmitters in the Public Mobile

Services

Mobile Base, fixed [SU][le][/ Mobile Frequency range (MHz) (ppm) SU]3 watts [le]3 (ppm) (ppm)				
25 to 50	20.0	20.0	50.0	
50 to 450	5.0	5.0	50.0	
450 to 512	2.5	5.0	5.0

929 to 960	1.5	n/a	n/a	
2110 to 2220	10.0	n/a	n/a	

Test Procedure

Frequency Stability vs. Temperature: The equipment under test was connected to an external DC power supply and the RF output was connected to a frequency counter via feed-through attenuators. The EUT was placed inside the temperature chamber. The DC leads and RF output cable exited the chamber through an opening made for the purpose.

After the temperature stabilized for approximately 20 minutes, the frequency output was recorded from the counter.

Frequency Stability vs. Voltage: An external variable DC power supply was connected to the battery terminals of the equipment under test. The voltage was set to 115% of the nominal value and was then decreased until the transmitter light no longer illuminated; i.e., the battery end point. The output frequency was recorded for each battery voltage.

Test Equipment List and Details

Manufacturer	Description	Model	Serial Number	Cal. Due Date
Tenney	Oven, Temperature	VersaTenn	12.222-193	2005-06-04
	Counter, Microwave			
HP	Frequency	5342A	2232A06380	2004-09-07

* **Statement of Traceability:** BACL attests that all calibrations have been performed per the NVLAP requirements, traceable to NIST.

Environmental Conditions

Temperature:	22° C
Relative Humidity:	48%
ATM Pressure:	1018 mbar

The testing was performed by Daniel Deng on 2005-04-26.

Test Results

Frequency Stability Versus Temperature

Reference Frequency: 836.6 MHz, Limit: 1.5ppm					
Environment Temperature	Power Supplied	Frequency	Measure with Time Elapsed		
(°C)	(VAc)	MHz	PPM Error		
50	120	836.599107	-1.07		
40	120	836.599197	-0.96		
30	120	836.599252	-0.89		
20	120	836.599309	-0.83		
10	120	836.599421	-0.69		
0	120	836.599582	-0.5		
-10	120	836.599483	-0.62		
-20	120	836.599532	-0.56		
-30	120	836.599781	-0.26		

Frequency Stability Versus Voltage

Reference Frequency: 836.6MHz, Limit: 1.5ppm						
Power Supplied (VAc)	Environment Temperature (°C)	MHz	ppm			
102	20	836.599328	-0.8			
138	20	836.599301	-0.84			

§22.917 – BAND EDGE

Applicable Standard

According to § 22.917, the power of any emission outside of the authorized operating frequency ranges must be attenuated below the transmitting power (P) by a factor of at least $43 + 10 \log(P) dB$.

Test Procedure

The RF output of the transmitter was connected to the input of the spectrum analyzer through sufficient attenuation.

The center of the spectrum analyzer was set to block edge frequency, RBW set to 30KHz.

Test Equipment List and Details

Manufacturer	Description	Model	Serial Number	Cal. Date
Agilent	Spectrum Analyzer	8564E	3943A01781	2004-10-04
HP	Plotter	HP7470A	2541A49659	N/R

* **Statement of Traceability:** BACL attests that all calibrations have been performed per the NVLAP requirements, traceable to NIST.

Environmental Conditions

Temperature:	22° C
Relative Humidity:	48%
ATM Pressure:	1018 mbar

The testing was performed by Daniel Deng on 2005-04-26.

Test Results

Please refer to the following plots.

$f_{low} = 824.4 MHz$, QPSK, 640ksym/s

f_{high} = 848.6MHz, QPSK, 640ksym/s

$f_{low} = 824.4 MHz$, QPSK, 640ksym/s

 $f_{high} = 848.2 MHz$, QPSK, 1280ksym/s

$f_{low} = 824.4 MHz, 16QAM, 640 ksym/s$

$f_{high} = 848.6 MHz$, 16QAM, 640ksym/s

$f_{low} = 824.8 MHz$, 16QAM, 1280ksym/s

 $f_{high} = 848.2 MHz$, 16QAM, 1280ksym/s

$f_{low} = 825.6 MHz$, 16QAM, 2580ksym/s

 $f_{high} = 847.4 MHz$, 16QAM, 2580ksym/s

f_{low} = 825.6MHz, QPSK, 2580ksym/s

 $f_{high} = 847.4 MHz$, QPSK, 2580ksym/s
