**TABLE OF CONTENTS**

# 1    INTRODUCTION

At the request of Beam Technologies LLC the Beam Brush 3.0 was evaluated for SAR in accordance with the requirements for FCC Part 2.1093 and RSS-102 Issue 5.  Testing was performed in accordance with IEEE Std 1528:2013, IEC62209-2:2010, and the Office of Engineering and Technology KDB 447498.  Testing was performed at the Intertek facility in Lexington, Kentucky.

For the evaluation, the dosimetric assessment system DASY52 was used. The total uncertainty for the evaluation of the spatial peak SAR values averaged over a cube of 1g tissue mass had been assessed for this system to be ±22.2% from 300MHz – 3GHz and 24.6% from 3GHz – 6GHz.

The Beam Brush 3.0 was tested at the maximum output power measured by Intertek. Maximum output power measurements are tabulated under Section 8 Test Results.  The maximum spatial peak SAR value for the sample device averaged over 1g (for body worn mode) and 10g (for hand-held mode) is shown below.

Based on the worst-case data presented below, the Beam Brush 3.0 was found to be **compliant** with the 1.6 W/kg requirements for general population / uncontrolled exposure.

*Table 1: Worst Case Reported SAR per Exposure Condition*

| Device Position | Transmit Mode | Separation Distance | Channel | Conducted Output Power (dBm) | Reported SAR (W/kg) | Limit (W/kg) |
|---|---|---|---|---|---|---|
| Left Cheek Touch | 802.11b | 0mm | 6 | 22.97 | 0.983 | 1.6W/kg |
| Right Cheek Touch | 802.11b | 0mm | 11 | 23.41 | 1.010 | 1.6W/kg |

## 2    TEST SITE DESCRIPTION

The SAR test site located at 731 Enterprise Drive, Lexington KY 40510 is comprised of the SPEAG model DASY 5.2 automated near-field scanning system, which is a package, optimized for dosimetric evaluation of mobile radios [3].  This system is installed in an ambient-free shielded chamber.  The ambient temperature is controlled to 22.0 $\pm 2^{\circ}$C.  During the SAR evaluations, the RF ambient conditions are monitored continuously for signals that might interfere with the test results.  The tissue simulating liquid is also stored in this area in order to keep it at the same constant ambient temperature as the room.

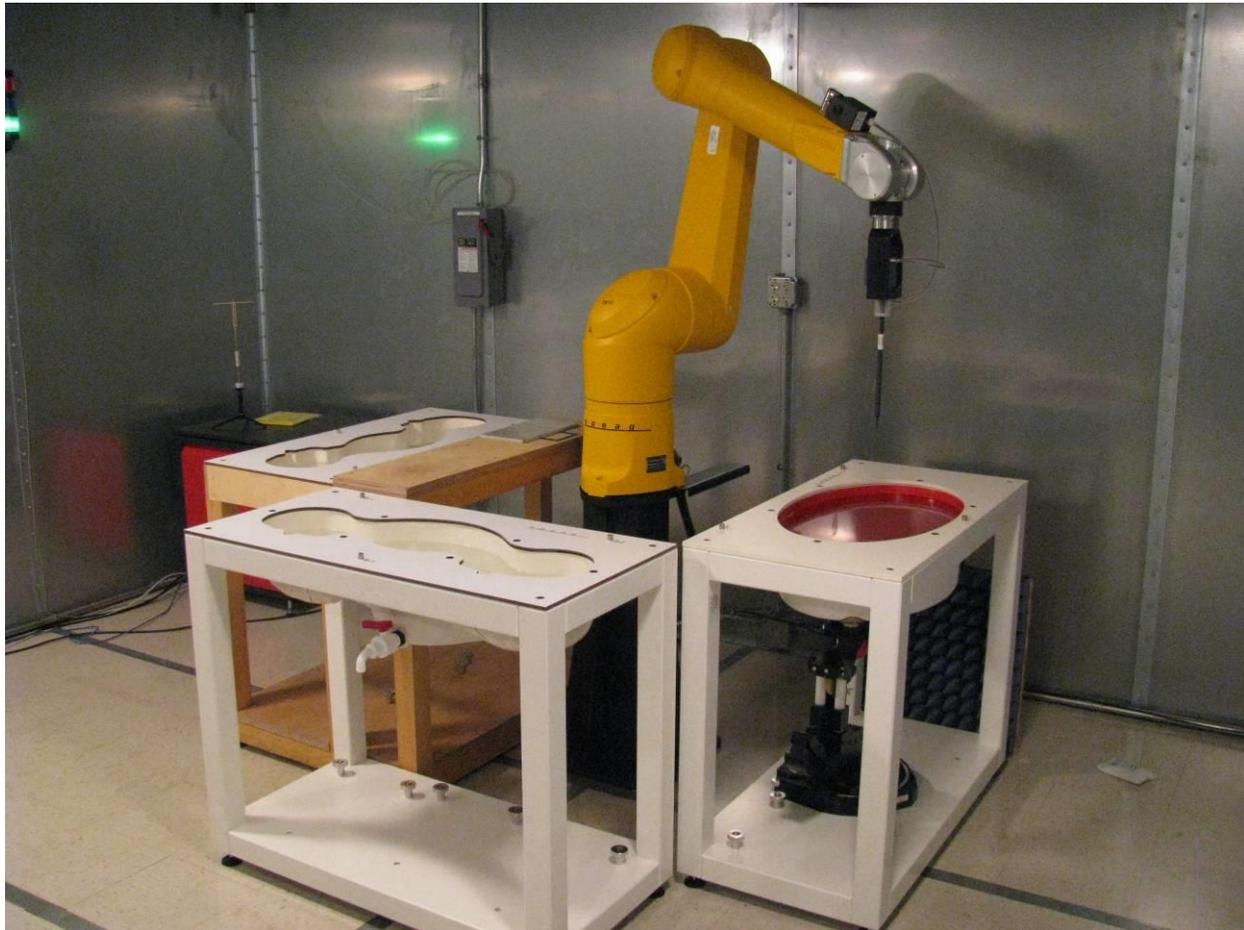

*Figure 1: Intertek SAR Test Site*

## 2.1    Measurement Equipment

The following major equipment/components were used for the SAR evaluation:

*Table 2: Test Equipment Used for SAR Evaluation*

| Description | Serial Number | Manufacturer | Model | Cal. Date | Cal. Due |
|---|---|---|---|---|---|
| SAR Probe | 3516 | Speag | EXDV3 | 11/12/2021 | 11/12/2022 |
| 2450MHz Dipole | 718 | Speag | D240V2 | 11/9/2021 | 11/9/2022 |
| DAE | 358 | Speag | DAE4 | 11/10/2021 | 11/10/2022 |

## 2.2 Measurement Uncertainty

The Tables below includes the uncertainty budget suggested by the IEEE Std 1528-2013 and IEC62209-2: 2010 as determined by SPEAG for the DASY5 measurement System.

| Error Description | Uncertainty Value | Prob. Dist. | Div. | $c_i$ (1g) | $c_i$ (10g) | Std.Unc. (1g) | Std.Unc. (10g) | $(v_i)$ $v_{eff}$ |
|---|---|---|---|---|---|---|---|---|
| Measurement System | | | | | | | | |
| Probe Calibration | ±6.0% | N | 1 | 1 | 1 | ±6.0% | ±6.0% | ∞ |
| Axial Isotropy | ±4.7% | R | √3 | 0.7 | 0.7 | ±1.9% | ±1.9% | ∞ |
| Hemispherical Isotropy | ±9.6% | R | √3 | 0.7 | 0.7 | ±3.9% | ±3.9% | ∞ |
| Boundary Effect | ±1.0% | R | √3 | 1 | 1 | ±0.6% | ±0.6% | ∞ |
| Linearity | ±4.7% | R | √3 | 1 | 1 | ±2.7% | ±2.7% | ∞ |
| System Detection Limits | ±1.0% | R | √3 | 1 | 1 | ±0.6% | ±0.6% | ∞ |
| Modulation Response | ±2.4% | R | √3 | 1 | 1 | ±1.4% | ±1.4% | ∞ |
| Readout Electronics | ±0.3% | N | 1 | 1 | 1 | ±0.3% | ±0.3% | ∞ |
| Response Time | ±0.8% | R | √3 | 1 | 1 | ±0.5% | ±0.5% | ∞ |
| Integration Time | ±2.6% | R | √3 | 1 | 1 | ±1.5% | ±1.5% | ∞ |
| RF Ambient Noise | ±3.0% | R | √3 | 1 | 1 | ±1.7% | ±1.7% | ∞ |
| RF Ambient Reflections | ±3.0% | R | √3 | 1 | 1 | ±1.7% | ±1.7% | ∞ |

| Phantom and Setup | | | | | | | | |
| Phantom Uncertainty | ±6.1% | R | √3 | 1 | 1 | ±3.5% | ±3.5% | ∞ |
| SAR Correction | ±1.9% | R | √3 | 1 | 0.84 | ±1.1% | ±0.9% | ∞ |
| Liquid Conductivity (mea.) | ±2.5% | R | √3 | 0.78 | 0.71 | ±1.1% | ±1.0% | ∞ |
| Liquid Permittivity(mea.) | ±2.5% | R | √3 | 0.26 | 0.26 | ±0.3% | ±0.4% | ∞ |
| Temp unc. - Conductivity | ±3.4% | R | √3 | 0.78 | 0.71 | ±1.5% | ±1.4% | ∞ |
| Temp unc. - Permittivity | ±0.4% | R | √3 | 0.23 | 0.26 | ±0.1% | ±0.1% | ∞ |
| Combined Standard Uncertainty | | | | | | ±11.2% | ±11.1% | 361 |
| Expanded STD Uncertainty | | | | | | ±22.3% | ±22.2% | |

Notes:

Worst Case uncertainty budget for DASY5 assessed according to IEEE 1528-2013. The budget is valid for the frequency range 300 MHz – 3 GHz and represents a worst-case analysis. For specific tests and configurations, the uncertainty could be considerably smaller.

| Error Description | Uncertainty Value | Prob. Dist. | Div. | $c_i$ (1g) | $c_i$ (10g) | Std.Unc. (1g) | Std.Unc. (10g) | ($v_i$) $v_{eff}$ |

| 2.4GHz ISM | BLE | GFSK | 2402 – 2480MHz | 8dBm | 1:1 |

## 4     SYSTEM VERIFICATION

**System Validation**

Prior to the assessment, the system was verified to be within ±10% of the specifications by using the system validation kit.  The system validation procedure tests the system against reference SAR values and the performance of probe, readout electronics and software. The test setup utilizes a phantom and reference dipole.

*Figure 2:  System Verification Setup*

**Tissue Simulating Liquid Description and Validation**

The dielectric parameters were verified to be within 5% of the target values prior to assessment.  The dielectric parameters ($\varepsilon_r$, $\sigma$ ) are shown in Table 4.  A recipe for the tissue simulating fluid used is shown in Table 5.

## 5    EVALUATION PROCEDURES

Prior to any testing, the appropriate fluid was used to fill the phantom to a depth of 15 cm $\pm$0.2cm.  The fluid parameters were verified and the dipole validation was performed as described in the previous sections.

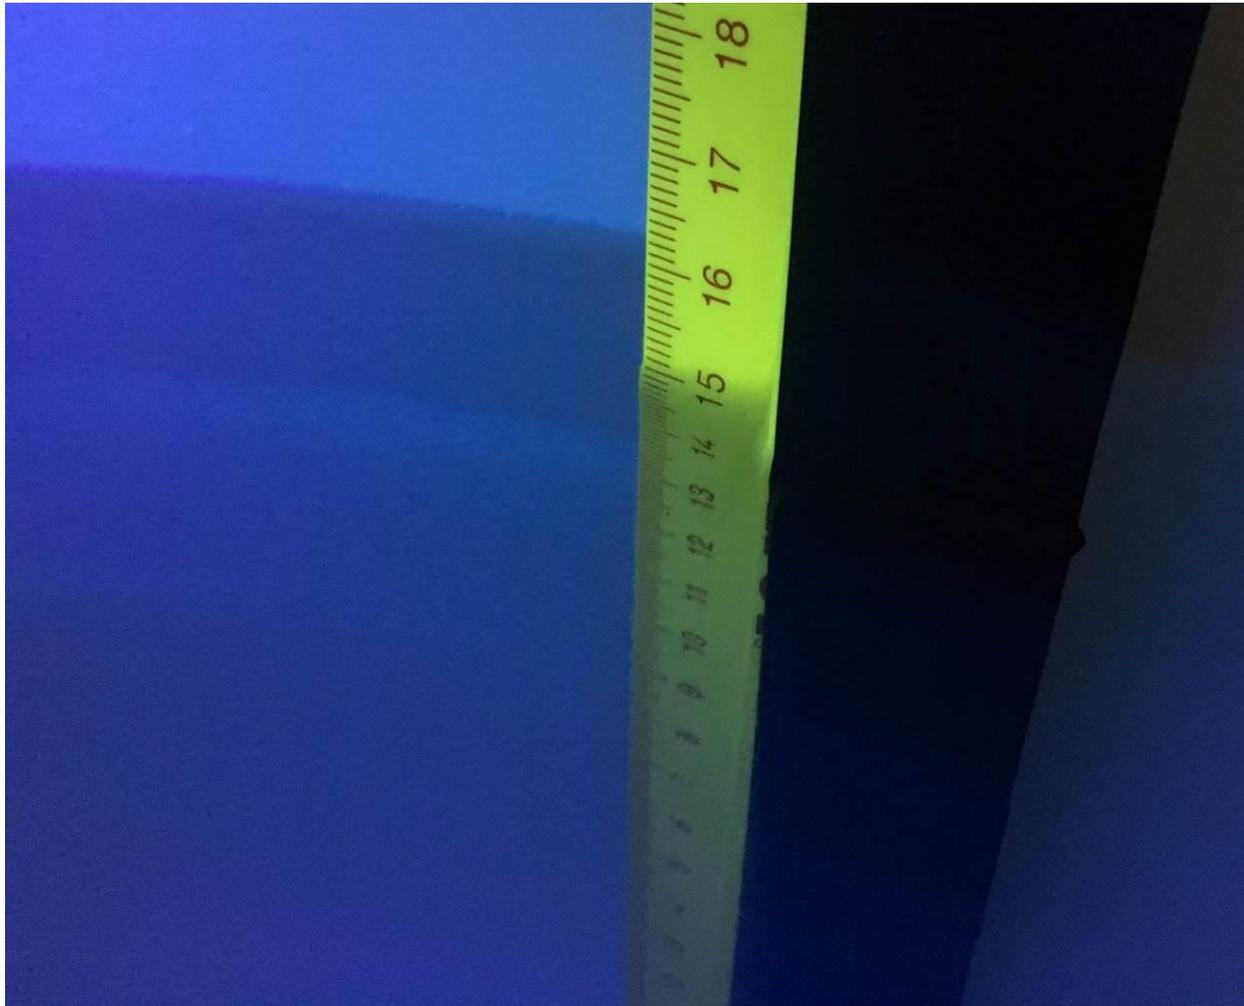

*Figure 3:  Fluid Depth 15cm*

**Test Positions:**

The Device was positioned against the SAM and flat phantom using the exact procedure described in IEEE Std 1528:2013, IEC62209-2:2010, and the Office of Engineering and Technology KDB 447498.

**Reference Power Measurement:**

The measurement probe was positioned at a fixed location above the reference point.  A power measurement was made with the probe above this reference position so it could used for the assessing the power drift later in the test procedure.

**Area Scan:**

A coarse area scan was performed in order to find the approximate location of the peak SAR value. This scan was performed with the measurement probe at a constant height in the simulating fluid.  A two dimensional spline interpolation algorithm was then used to determine the peaks and gradients within the scanned area.  The area scan resolution conformed to the requirements of KDB 865664 as shown in Table 6.

**Zoom Scan:**

A zoom scan was performed around the approximate location of the peak SAR as determined from the area scan. On the basis of this data set, the spatial peak SAR value was evaluated with the following procedure.  The zoom scan resolution conformed to the requirements of KDB 865664 as shown in Table 6.

*Table 6: SAR Area and Zoom Scan Resolutions*

| | | | ≤ 3 GHz | > 3 GHz |
|---|---|---|---|---|
| Maximum distance from closest measurement point (geometric center of probe sensors) to phantom surface | | | 5 ± 1 mm | ½·δ·ln(2) ± 0.5 mm |
| Maximum probe angle from probe axis to phantom surface normal at the measurement location | | | 30° ± 1° | 20° ± 1° |
| Maximum area scan spatial resolution: $\Delta x_{Area}$, $\Delta y_{Area}$ | | | ≤ 2 GHz: ≤ 15 mm<br>2 – 3 GHz: ≤ 12 mm | 3 – 4 GHz: ≤ 12 mm<br>4 – 6 GHz: ≤ 10 mm |
| | | | When the x or y dimension of the test device, in the measurement plane orientation, is smaller than the above, the measurement resolution must be ≤ the corresponding x or y dimension of the test device with at least one measurement point on the test device. | |
| Maximum zoom scan spatial resolution: $\Delta x_{Zoom}$, $\Delta y_{Zoom}$ | | | ≤ 2 GHz: ≤ 8 mm<br>2 – 3 GHz: ≤ 5 mm* | 3 – 4 GHz: ≤ 5 mm*<br>4 – 6 GHz: ≤ 4 mm* |
| Maximum zoom scan spatial resolution, normal to phantom surface | uniform grid: $\Delta z_{Zoom}(n)$ | | ≤ 5 mm | 3 – 4 GHz: ≤ 4 mm<br>4 – 5 GHz: ≤ 3 mm<br>5 – 6 GHz: ≤ 2 mm |
| | graded grid | $\Delta z_{Zoom}(1)$: between 1st two points closest to phantom surface | ≤ 4 mm | 3 – 4 GHz: ≤ 3 mm<br>4 – 5 GHz: ≤ 2.5 mm<br>5 – 6 GHz: ≤ 2 mm |
| | | $\Delta z_{Zoom}(n>1)$: between subsequent points | ≤ 1.5·$\Delta z_{Zoom}(n-1)$ | |
| Minimum zoom scan volume | x, y, z | | ≥ 30 mm | 3 – 4 GHz: ≥ 28 mm<br>4 – 5 GHz: ≥ 25 mm<br>5 – 6 GHz: ≥ 22 mm |

Note: δ is the penetration depth of a plane-wave at normal incidence to the tissue medium; see draft standard IEEE P1528-2011 for details.

* When zoom scan is required and the *reported* SAR from the *area scan based 1-g SAR estimation* procedures of KDB 447498 is ≤ 1.4 W/kg, ≤ 8 mm, ≤ 7 mm and ≤ 5 mm zoom scan resolution may be applied, respectively, for 2 GHz to 3 GHz, 3 GHz to 4 GHz and 4 GHz to 6 GHz.

**Interpolation, Extrapolation and Detection of Maxima:**

The probe is calibrated at the center of the dipole sensors which is located 1 to 2.7 mm away from the probe tip. During measurements, the probe stops shortly above the phantom surface, depending on the probe and the surface detecting system. Both distances are included as parameters in the probe configuration file. The software always knows exactly how far away the measured point is from the surface. As the probe cannot directly measure at the surface, the values between the deepest measured point and the surface must be extrapolated.

In DASY5, the choice of the coordinate system defining the location of the measurement points has no influence on the uncertainty of the interpolation, Maxima Search and extrapolation routines. The interpolation, extrapolation and maximum search routines are all based on the modified Quadratic Shepard's method.

Thereby, the interpolation scheme combines a least-square fitted function method and a weighted average method which are the two basic types of computational interpolation and approximation. The DASY5 routines construct a once-continuously differentiable function that interpolates the measurement values as follows:

- For each measurement point a trivariate (3-D) / bivariate (2-D) quadratic is computed. It interpolates the measurement values at the data point and forms a least-square fit to neighboring measurement values.

- The spatial location of the quadratic with respect to the measurement values is attenuated by an inverse distance weighting. This is performed since the calculated quadratic will fit measurement values at nearby points more accurate than at points located further away.

- After the quadratics are calculated for at all measurement points, the interpolating function is calculated as a weighted average of the quadratics.

There are two control parameters that govern the behavior of the interpolation method. One specifies the number of measurement points to be used in computing the least-square fits for the local quadratics. These measurement points are the ones nearest the input point for which the quadratic is being computed. The second parameter specifies the number of measurement points that will be used in calculating the weights for the quadratics to produce the final function. The input data points used there are the ones nearest the point at which the interpolation is desired. Appropriate defaults are chosen for each of the control parameters.

The trivariate quadratics that have been previously computed for the 3-D interpolation and whose input data are at the closest distance from the phantom surface, are used in order to extrapolate the fields to the surface of the phantom.

In order to determine all the field maxima in 2-D (Area Scan) and 3-D (Zoom Scan), the measurement grid is refined by a default factor of 10 and the interpolation function is used to evaluate all field values between corresponding measurement points. Subsequently, a linear search is applied to find all the candidate maxima. In a last step, non-physical maxima are removed and only those maxima which are within 2 dB of the global maximum value are retained.

**Averaging and Determination of Spatial Peak SAR**

The interpolated data is used to average the SAR over the 1g and 10g cubes by spatially discretizing the entire measured volume. The resolution of this spatial grid used to calculate the averaged SAR is 1mm or about 42875 interpolated points. The resulting volumes are defined as cubical volumes containing the appropriate tissue parameters that are centered at the location. The location is defined as the center of the incremental volume.

The spatial-peak SAR must be evaluated in cubical volumes containing a mass that is within 5% of the required mass. The cubical volume centered at each location, as defined above, should be expanded in all directions until the desired value for the mass is reached, with no surface boundaries of the averaging volume extending beyond the outermost surface of the considered region. In addition, the cubical volume should not consist of more than 10% of air. If these conditions are not satisfied then the center of the averaging volume is moved to the next location. Otherwise, the exact size of the final sampling cube is found using an inverse polynomial approximation algorithm, leading to results with improved accuracy. If one boundary of the averaging volume reaches the boundary of the measured volume during its expansion, it will not be evaluated at all. Reference is kept of all locations used and those not used for averaging the SAR. All average SAR values are finally assigned to the centered location in each valid averaging volume.

All locations included in an averaging volume are marked to indicate that they have been used at least once. If a location has been marked as used, but has never been assigned to the center of a cube, the highest averaged SAR value of all other cubical volumes which have used this location for averaging is assigned to this location. Only those locations that are not part of any valid averaging volume should be marked as unused. For the case of an unused location, a new averaging volume must be constructed which will have the unused location centered at one surface of the cube. The remaining five surfaces are expanded evenly in all directions until the required mass is enclosed, regardless of the amount of included air. Of the six possible cubes with one surface centered on the unused location, the smallest cube is used, which still contains the required mass.

If the final cube containing the highest averaged SAR touches the surface of the measured volume, an appropriate warning is issued within the post processing engine.

**Power Drift Measurement:**

The probe was positioned at precisely the same reference point and the reference power measurement was repeated. The difference between the initial reference power and the final one is referred to as the power drift. This value should not exceed 5%. The power drift measurement was used to assess the output power stability of the test sample throughout the SAR scan.

**RF Ambient Activity:**

During the entire SAR evaluation, the RF ambient activity was monitored using a spectrum analyzer with an antenna connected to it. The spectrum analyzer was tuned to the frequency of measurement and with one trace set to max hold mode. In this way, it was possible to determine if at any point during the SAR measurement there was an interfering ambient signal. If an ambient signal was detected, then the SAR measurement was repeated.

## 6    CRITERIA

The following ANSI/IEEE C95.1 – 1992  limits for SAR apply to portable devices operating in the General Population/Uncontrolled Exposure environment.  Uncontrolled environments are defined as locations where there is the exposure of individuals who have no knowledge or control of their exposure.

| Exposure Type (General Population/Uncontrolled Exposure environment) | SAR Limit (W/kg or mW/g) |
| --- | --- |
| Average over the whole body | 0.08 |
| Spatial Peak (1g) | 1.60 |
| Spatial Peak for hands, wrists, feet and ankles (10g) | 4.00 |

## 7    TEST CONFIGURATION

The Beam Brush 3.0 was designed to be used against the head while brushing your teeth.  It could be used against either the right side of the head or the left side of the head.  Therefore, SAR testing was performed in both left and right cheek touch positions with the area near the antenna touching the SAR phantom.

The device was evaluated according to the specific requirements found in the following KDBs and Standards:

- FCC KDB 447498D01 v06, General RF Exposure Guidance

- FCC KDB 865664D01 v01r04, SAR Measurement Requirements for 100MHz to 6GHz

- FCC KDB 248227 D01 802.11 wi-Fi SAR v02r02, SAR Guidance for IEEE 802.11 (Wi-Fi) Transmitters

- RSS-102 Issue 5, Radio Frequency (RF) Exposure Compliance of Radiocommunication Apparatus (All Frequency Bands)

## 8   TEST RESULTS

The worst case 1g SAR value for head exposure was less than the 1.6W/kg limit.

## 9   SAR DATA:

The results on the following page(s) were obtained when the device was transmitting at maximum output power. The worst case plots, which reveal information about the location of the maximum SAR with respect to the device, are referenced are shown in APPENDIX B – Worst Case SAR Plot.  The measured conducted output power was compared to the power declared by the manufacturer and used for scaling the measured SAR values.

*Table 7: SAR Results*

| | | | | | | | Measured | Maximum |
|---|---|---|---|---|---|---|---|---|

| 2.4GHz Band Head SAR Results | | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| TX Mode | Spacing | Channel | Position | Power Drift (dB) | Measured SAR 1g (W/kg) | Reported SAR 1g (W/kg) | Measured Conducted Output Power (dBm) | Maximum Conducted Output Power (dBm) |
| 802.11b | cheek touching | 1 | left cheek touch | 0.09 | 0.8840 | **0.8840** | 22.28 | 22.28 |
| | | | right cheek touch | 0.17 | 0.9730 | **0.9730** | 22.28 | 22.28 |
| | | 6 | left cheek touch | 0.13 | 0.9830 | **0.9830** | 22.97 | 22.66 |
| | | | right cheek touch | 0.08 | 0.9870 | **0.9870** | 22.97 | 22.66 |
| | | 11 | left cheek touch | 0.35 | 0.9220 | **0.9220** | 23.41 | 23.30 |
| | | | right cheek touch | 0.35 | 1.0100 | **1.0100** | 23.41 | 23.30 |
| Bluetooth | cheek touching | Middle | left cheek touch | -0.02 | 0.0240 | **0.0260** | 7.66 | 8.00 |
| | | | right cheek touch | -0.12 | 0.0220 | **0.0238** | 7.66 | 8.00 |
| **1g SAR Limit = 1.6W/kg** | | | | | | | | |

| | | | |
|---|---|---|---|
| Test Personnel: | Bryan Taylor | Test Date: | 12/13/2021 – 12/14/2021 |
| Supervising/Reviewing Engineer: | NA | Tissue Depth: | 15cm |
| Signal Setup: | Test Commands | Ambient Temperature: | 22.4C |
| Power Method: | Fully Charged Battery | Relative Humidity: | 48.6% |
| Pretest Dipole Verification: | Yes | Atmospheric Pressure: | 989.2mbar |

Deviations, Additions, or Exclusions:

1) Per KDB 248227D01 Section 5.2.2, the OFDM SAR measurements were excluded since the reported SAR for DSSS was less than 1.2W/kg and the OFDM specified maximum output power was the same as DSSS specified maximum output power.

2) The worst case measured SAR was >0.8W/kg. Per KDB 865664 D01 this SAR measurement was repeated and found to vary by less than 20%.

## 10   APPENDIX A – SYSTEM VALIDATION SUMMARY

Per FCC KDB 865664, a tabulated summary of the system validation status including the validation date(s), measurement frequencies, SAR probes and tissue dielectric parameters have been included in the summary table below.  The validation was performed with reference dipoles using the required tissue equivalent media for system validation according to KDB 865664.  Each probe calibration point was validated at a frequency within the valid frequency range of the probe calibration point.  All measurements were performed using probes calibrated for CW signals.  Modulations in the table above represent test configurations for which the SAR system has been validated.  The SAR system was also validated with modulated signals per KDB 865664.

*Table 8: SAR System Validation Summary*

## 11    APPENDIX B – WORST CASE SAR PLOT

Date/Time: 12/14/2021 1:35:28 PM

Test Laboratory: Intertek
File Name: SAR_FCC_2.4GHz Band.da52:2

**SAR_FCC_2.4GHz Band**

Procedure Notes:

**DUT: Brush; Serial:**

Communication System: UID 0, Generic 802.11b/g/n (0); Communication System Band: 2.4 GHz Band; Frequency: 2462 MHz;Duty Cycle: 1:1

Medium parameters used (interpolated): f = 2462 MHz; $\sigma$ = 1.88 S/m; $\varepsilon_r$ = 37.862; $\rho$ = 1000 kg/m$^3$

Phantom section: Right Section
Measurement Standard: DASY5 (IEEE/IEC/ANSI C63.19-2007)

DASY5 Configuration:

- Probe: EX3DV3 - SN3516; ConvF(8.46, 8.46, 8.46); Calibrated: 11/12/2021;

- Sensor-Surface: 2mm (Mechanical Surface Detection), Sensor-Surface: 4mm (Mechanical Surface Detection)

- Electronics: DAE4 Sn358; Calibrated: 11/10/2021

- Phantom: SAM 2 with CRP v5.0; Type: QD000P40CD; Serial: TP:1663

- DASY52 52.8.7(1137); SEMCAD X 14.6.10(7164)

**Right-Hand-Side HSL/Right Hand Side High/Area Scan (61x51x1):** Interpolated grid: dx=1.500 mm, dy=1.500 mm

Maximum value of SAR (interpolated) = 1.41 W/kg

**Right-Hand-Side HSL/Right Hand Side High/Zoom Scan (7x7x7)/Cube 0:** Measurement grid: dx=5mm, dy=5mm, dz=5mm
Reference Value = 3.679 V/m; Power Drift = 0.35 dB
Peak SAR (extrapolated) = 1.58 W/kg
**SAR(1 g) = 1.01 W/kg; SAR(10 g) = 0.519 W/kg**

Maximum value of SAR (measured) = 1.14 W/kg
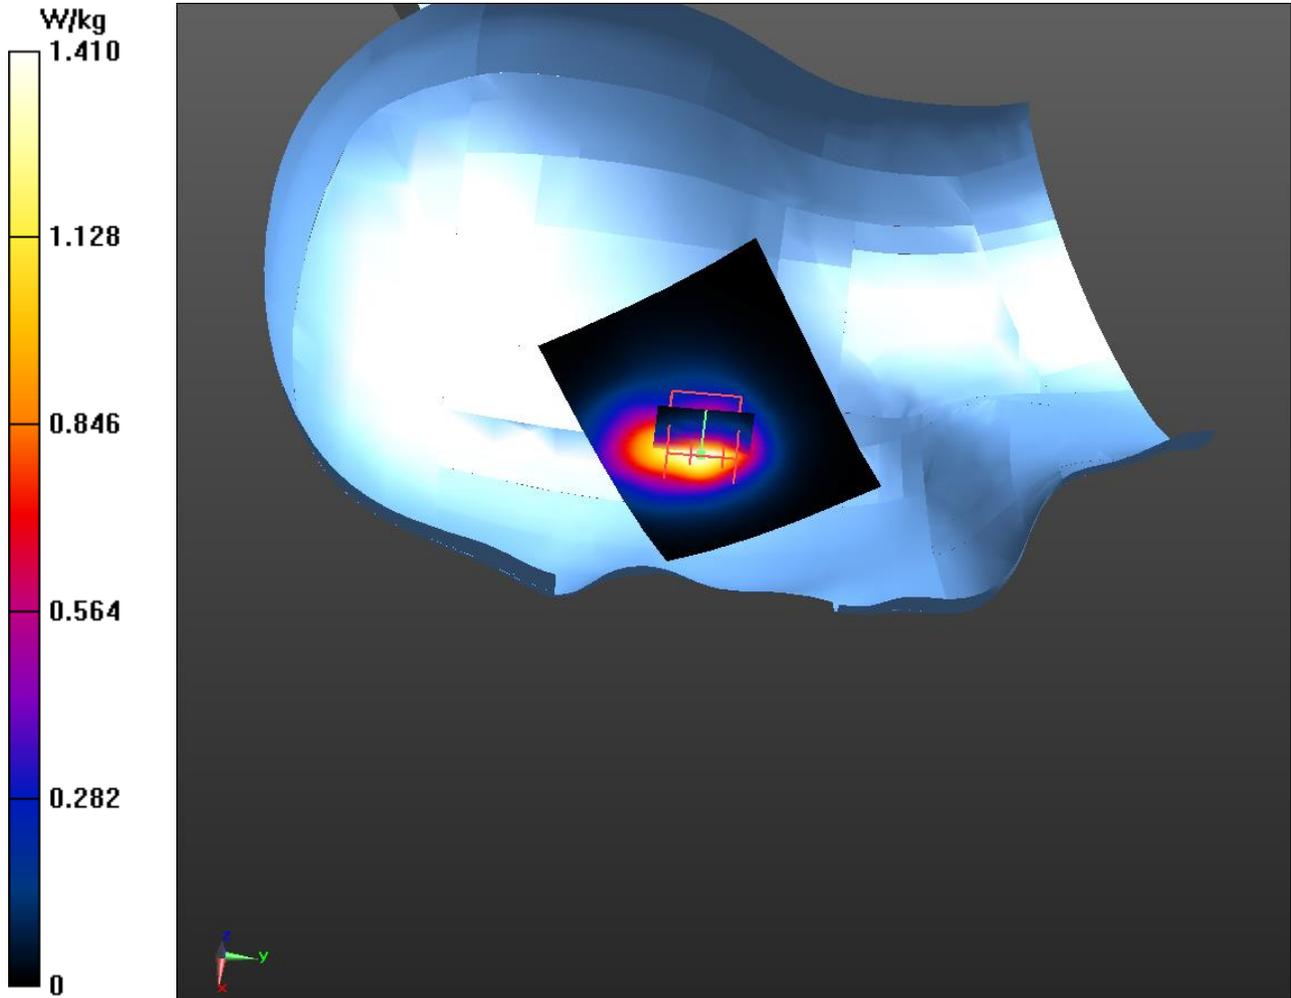

## 12    APPENDIX C – DIPOLE VALIDATION PLOTS

Date/Time: 12/12/2021 4:47:44 PM

Test Laboratory: Intertek
File Name: [Dipole 2450.da52:4](Dipole 2450.da52:4)

### 12.1.1    Dipole 2450

Procedure Notes:

**DUT: Dipole 2450 MHz D2450V2; Serial: D2450V2 - SN:xxx**

Communication System: UID 0, CW (0); Communication System Band: D2450 (2450.0 MHz); Frequency: 2450 MHz;Duty Cycle: 1:1

Medium parameters used: f = 2450 MHz; $\sigma$ = 1.905 S/m; $\varepsilon_r$ = 38.602; $\rho$ = 1000 kg/m$^3$

Phantom section: Flat Section
Measurement Standard: DASY5 (IEEE/IEC/ANSI C63.19-2007)

DASY5 Configuration:

- Probe: EX3DV3 - SN3516; ConvF(8.46, 8.46, 8.46); Calibrated: 11/12/2021;

- Sensor-Surface: 1.4mm (Mechanical Surface Detection)

- Electronics: DAE4 Sn358; Calibrated: 11/10/2021

- Phantom: SAM 2 with CRP v5.0; Type: QD000P40CD; Serial: TP:1663

- DASY52 52.8.7(1137); SEMCAD X 14.6.10(7164)

**WWAN Flat-Section HSL Testing/2450MHz Dipole/Area Scan 2 (41x71x1):** Interpolated grid: dx=1.500 mm, dy=1.500 mm
Maximum value of SAR (interpolated) = 0.0977 W/kg

**WWAN Flat-Section HSL Testing/2450MHz Dipole/Zoom Scan (9x9x7)/Cube 0:** Measurement grid: dx=5mm, dy=5mm, dz=5mm
Reference Value = 6.569 V/m; Power Drift = -0.05 dB
Peak SAR (extrapolated) = 105 W/kg
**SAR(1 g) = 51.6 W/kg; SAR(10 g) = 24.1 W/kg**
Normalized to target power = 1 W and actual power = 0.001 W
Maximum value of SAR (measured) = 85.1 W/kg
