# 1 Foreword

#### 1.1 Introduction

This document describes the electrical characteristics, RF performance, structure size, application environment, etc. of NL668-AM module. With the assistance of the document and other instructions, the developers can quickly understand the hardware functions of the NL668-AM module and develop products.

# 1.2 Safety Instruction

By following the safety guidelines below, you can ensure your personal safety and help protect the product and work environment from potential damage. Product manufacturers need to communicate the following safety instructions to end users. In case of failure to comply with these safety rules, Fibocom will not be responsible for the consequences caused by the user's misuse.

Road safety first! When you drive, do not use the handheld devices even if it has a hand-free feature. Please stop and call.

Please turn off the mobile device before boarding. The wireless feature of the mobile device is not allowed on the aircraft to prevent interference with the aircraft communication system. Ignoring this note may result in flight safety issue or even breaking the law.

When in a hospital or health care facility, please be aware of restrictions on the use of mobile devices. Radio frequency interference may cause medical equipment to malfunction, so it may be necessary to turn off the mobile device.

The mobile device does not guarantee that an effective connection can be made under any circumstances, for example, when there is no prepayment for the mobile device or the SIM is invalid. When you encounter the above situation in an emergency, remember to use an emergency call, while keeping your device turned on and in areas where signal is strong.

Your mobile device receives and transmits RF signals when it is powered on. Radio interference occurs when it is near televisions, radios, computers, or other electronic devices.

Keep the mobile device away from flammable gases. Turn off the mobile device when near gas stations, oil depots, chemical plants or explosive workplaces. There is a safety hazard in operating electronic equipment in any potentially explosive environment.

#### 1.3 Reference Standards

This design of the product complies with the following standards:

- 3GPP TS 51.010-1 V10.5.0: Mobile Station (MS) conformance specification; Part 1:
   Conformance specification
- 3GPP TS 34.121-1 V10.8.0: User Equipment (UE) conformance specification; Radio transmission and reception (FDD); Part 1: Conformance specification
- 3GPP TS 34.122 V10.1.0: Technical Specification Group Radio Access Network; Radio transmission and reception (TDD)
- 3GPP TS 36.521-1 V10.6.0: User Equipment (UE) conformance specification; Radio transmission and reception; Part 1: Conformance testing
- 3GPP TS 21.111 V10.0.0: USIM and IC card requirements
- 3GPP TS 51.011 V4.15.0: Specification of the Subscriber Identity Module -Mobile Equipment (SIM-ME) interface
- 3GPP TS 31.102 V10.11.0: Characteristics of the Universal Subscriber Identity Module (USIM)
   application
- 3GPP TS 31.11 V10.16.0: Universal Subscriber Identity Module (USIM) Application
   Toolkit(USAT)
- 3GPP TS 36.124 V10.3.0: Electro Magnetic Compatibility (EMC) requirements for mobile terminals and ancillary equipment
- 3GPP TS 27.007 V10.0.8: AT command set for User Equipment (UE)
- 3GPP TS 27.005 V10.0.1: Use of Data Terminal Equipment Data Circuit terminating Equipment

(DTE - DCE) interface for Short Message Service (SMS) and Cell Broadcast Service (CBS)

# 1.5 Federal Communication Commission Interference Statement

#### **FCC Regulations:**

This device complies with part 15 of the FCC Rules. Operation is subject to the following two conditions:

(1) This device may not cause harmful interference, and (2) This device must accept any interference received, including interference that may cause undesired operation.

This device has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiated radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- -Reorient or relocate the receiving antenna.
- -Increase the separation between the equipment and receiver.
- -Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- -Consult the dealer or an experienced radio/TV technician for help.

Caution: Changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate the equipment.

#### **RF Exposure Information:**

This device complies with FCC radiation exposure limits set forth for an uncontrolled environment. In order to avoid the possibility of exceeding the FCC radio frequency exposure limits, human proximity to the antenna shall not be less than 20cm (8 inches) during normal operation.

#### **IMPORTANT NOTE:**

This module is intended for OEM integrator. The OEM integrator is still responsible for the FCC compliance requirement of the end product, which integrates this module. 20cm minimum distance has to be able to be maintained between the antenna and the users for the host this module is integrated into. Under such configuration, the FCC radiation exposure limits set forth for an population/uncontrolled environment can be satisfied.

Any changes or modifications not expressly approved by the manufacturer could void the user's authority to operate this equipment.

#### **USERS MANUAL OF THE END PRODUCT:**

In the user manual of the end product, the end user has to be informed to keep at least 20cm separation with the antenna while this end product is installed and operated. The end user has to be informed that the FCC radio-frequency exposure guidelines for an uncontrolled environment can be satisfied. The end user has to also be informed that any changes or modifications not expressly approved by the manufacturer could void the user's authority to operate this equipment. If the size of the end product is smaller than 8x10cm, then additional FCC part 15.19 statement is required to be available in the users manual: This device complies with Part 15 of FCC rules. Operation is subject to the following two conditions: (1) this device may not cause harmful interference and (2) this device must accept any interference received, including interference that may cause undesired operation.

#### **LABEL OF THE END PRODUCT:**

The final end product must be labeled in a visible area with the following "Contains Transmitter Module FCC ID: ZMONL668AM01". If the size of the end product is larger than 8x10cm, then the following FCC part 15.19 statement has to also be available on the label: This device complies with Part 15 of FCC rules. Operation is subject to the following two conditions: (1) this device may not cause harmful interference and (2) this device must accept any interference received, including interference that may cause undesired operation.

# 2 Product Overview

# 2.1 Product Introduction

The NL668-AM wireless module is a wideband wireless terminal product applicable to various network formats and multi-bands including FDD-LTE/UMTS.

| Physical characteristics | Size: 32.0×29.0×2.4 mm               |   |  |  |  |
| Characteristics          | Weight: About 5.5g                   |   |  |  |  |
| Interface                |                                      |   |  |  |  |
| Antenna                  | Antenna: Main x 1, GNSS x 1, DIV x 1 |   |  |  |  |
| Functional               | USIM 3.0V/1.8V                       |   |  |  |  |

| Interface       | USB 2.0 x 1  |  |  |  |  |
|-----------------|--|--|--|--|--|
|                 | UART, PCM, I2C, SGMII, SDIO, GPIO, SPI   |  |  |  |  |
|                 | System Indicator   |  |  |  |  |
|                 | ADC  |  |  |  |  |
| Software        |  |  |  |  |  |
| Protocol Stack  | Embedded TCP/IP and UDP/IP protocol stack  |  |  |  |  |
| AT Command      | 3GPP TS 27.007 and 27.005, and proprietary FIBOCOM AT                            |  |  |  |  |
| Firmware update | USB(UART does not support DOWNLOAD)  |  |  |  |  |
| Voice service   | VoLTE, HR, FR, EFR, AMR, DTMF, Caller ID, Call Transfer, Call Hold, Call Waiting |  |  |  |  |
|                 | and Multi-Talk, etc.   |  |  |  |  |
| SMS             | point-to-point MO, MT; cell broadcast; support Text and PDU modes                |  |  |  |  |
| MMS service     | Need AP to realize MMS protocol  |  |  |  |  |

Table 2-1 Product Specifications

#### Note:

When the temperature is beyond the normal operating temperature range (-30 °C to + 75 °C), the RF performance of the module may slightly exceed the 3GPP specifications.

# 2.3 Hardware Diagram

Figure 2-2 hardware diagram shows the main hardware features of the NL668-AM module, including baseband and RF features.

#### Baseband includes:

- UMTS/ LTE FDD controller
- PMIC
- MCP
- UART, USB, SIM, PCM, I2C, SPI, SGMII, SDIO, ADC

#### RF includes:

- RF Transceiver
- RF PA
- RF filter
- Antenna

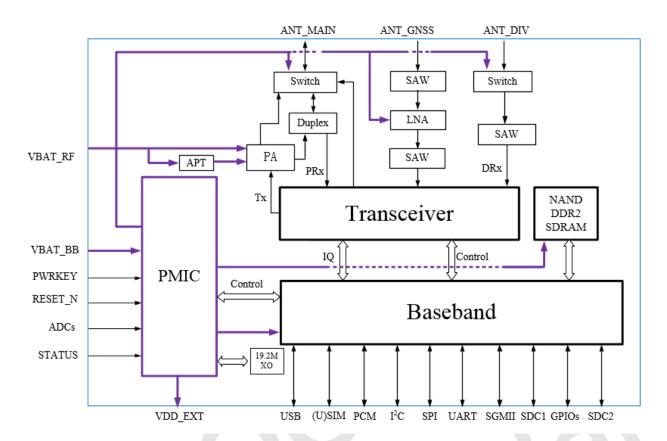

Figure 2-1 Hardware Diagram

# 3 Application Interface

#### 3.1 LCC Interface

NL668-AM module adopts LCC packaging, with a total of 144 pins.

#### 3.1.1 Pin distribution

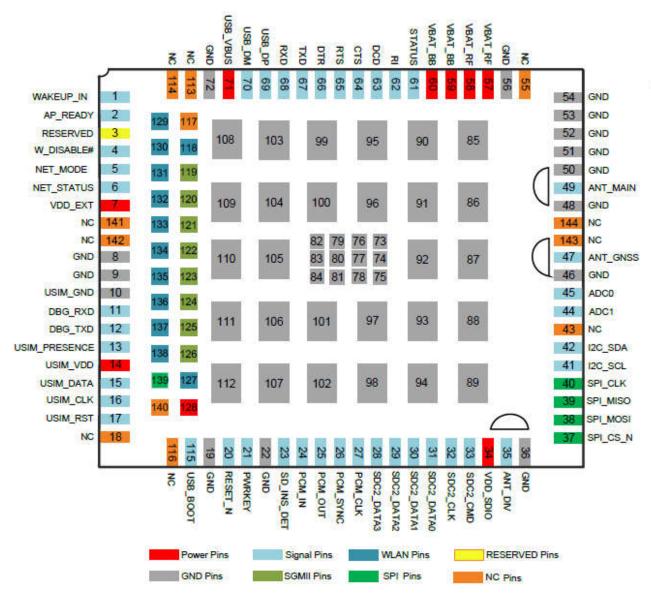

Figure 3-1 Pin Distribution Diagram(TOP plan perspective diagram)

#### Note:

"73 ~ 112" is the thermal pin, and the module is grounded internally. It is recommended that the heat sink pad is reserved for PCB packaging and welded.

#### 3.1.2 Pin definition

The pin definitions are shown in the following table:

| Pin | Pin Name      | I/O | Level  | Description                             |
|-----|---------------|-----|--|---|
| 1   | WAKEUP_IN     | ı   | VILMIN=-0.3V VILMAX=0.6V VIHMIN=1.2V VIHMAX=2.0V       | External device wake-up module          |

Table 3-1 Pin Definitions

#### Note:

Keep the unused pins floating.

Pin73~Pin112 is the module thermal pad, and the corresponding ground pad is reserved for PCB packaging and welded.

# 3.2 Power Supply

The power interfaces of NL668-AM module are shown in the following table:

| Pin Name | I/O | Pin                                       | Description                                       |  |
|----------|-----|---|---|--|
| VBAT_RF  | 1   | 57,58                                     | Module power supply, 3.3~4.3V, typical value 3.8V |  |
| VBAT_BB  | I   | 59,60                                     | Module power supply, 3.3~4.3V, typical value 3.8V |  |
| VDD_EXT  | 0   | 7   | Voltage Output, 1.8V, 80mA                        |  |
| GND      | -   | 8,9,10,19,22,36,46,48,5<br>0-54,56,72-112 | Ground  |  |

Table 3-2 Power Interfaces

#### Note:

In the rest of the document, VBAT\_BB, VBAT\_RF will be replaced with VBAT.

#### 3.2.1 Power supply

The NL668-AM module needs to be powered by the VBAT pin. The power design is shown in Figure 3-2:

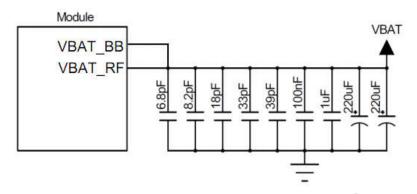

Figure 3-2 Power Design

Power filter capacitor design is shown in the following table:

| Recommended capacitor | Application                     | Description                                    |
|-----------------------|---------------------------------|--|
|                       |                                 | Reduce power fluctuations during               |
|                       |                                 | module operation, requiring low                |
|                       |                                 | ESR Capacitor                                  |
| 220uF x 2             | Regulating capacitor            | <ul> <li>LDO or DCDC power requires</li> </ul> |
|                       |                                 | not less than 440uF capacitor                  |
|                       | 10                              | Battery power can be properly                  |
|                       |                                 | reduced to 100 ~ 220uF capacitor               |
| 1E 100nE              | Digital signal paigs            | Filter clock and digital signal                |
| 1uF,100nF             | Digital signal noise            | interference                                   |
| 39pF,33pF             | 700, 850/900 MHz bands          | Filter low band RF interference                |
| 40,500,050,055        | 1700/1800/1900,2100/2300,2500/2 | Filter middle/high band RF                     |
| 18pF,8.2pF,6.8pF      | 600MHz bands                    | interference                                   |

Table 3-3 Power Filter Capacitor Design

The power stability ensures the normal operation of NL668-AM module. The design requires special attention to the power ripple below 300mV (The circuit ESR <  $100\text{m}\Omega$ ). When the module is operating in WCDMA/LTE mode (Burst transmit), the maximum operating current can reach 2A, and the power voltage needs to be at least 3.3V. Otherwise, the module may power off or restart. The power limit is shown in Figure 3-3:

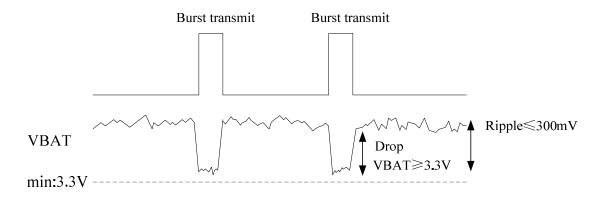

Figure 3-3 Power Limit

#### 3.2.2 1.8V Output

The NL668-AM outputs a 1.8V voltage through the VDD\_EXT for use of the internal digital circuit of the module. The voltage is the logic level voltage of the module and can be used to indicate that the module is on or off, or for external low current (<80mA) circuit. If it is not in use, keep it in floating status. The logic level of VDD\_EXT is defined as follows:

| Parameter | Minimum | Typical | Maximum | Unit |
|-----------|---------|---------|---------|------|
| VDD_EXT   | 1.71    | 1.8     | 1.89    | V    |

Table 3-4 VDD\_EXT Logic Level

#### 3.2.3 Power consumption

The power consumption of NL668-AM module in the case of 3.8V power supply is shown in the following table.

| Parameter          | Mode      | Condition                      | Average Typ.Current(mA) |
|--------------------|-----------|--------------------------------|-------------------------|
| l <sub>off</sub>   | Power off | Power supply, module power off | 0.015                   |
|                    | WCDMA     | DRX=8                          | ≤20                     |
| I <sub>Idle</sub>  | LTE FDD   | Paging cycle #256 frames       | ≤20                     |
|                    | Radio Off | AT+CFUN=4                      | ≤15                     |
|                    |           | DRX=6                          | ≤3                      |
| l <sub>sleep</sub> | WCDMA     | DRX=7                          | ≤3                      |
|                    | VVCDIVIA  | DRX=8                          | <b>≤</b> 3              |
|                    |           | DRX=9                          | <b>≤</b> 3              |

| Parameter              | Mode    | Condition                                | Average Typ.Current(mA) |
|------------------------|---------|--|-------------------------|
|                        |         | Paging cycle #64 frames                  | ≤3                      |
|                        | FDD-LTE | Paging cycle #128 frames                 | ≤3                      |
|                        |         | Paging cycle #256 frames                 | ≤3                      |
|                        |         | WCDMA Data transfer Band II<br>@+23.5dBm | ≤630                    |
| I <sub>WCDMA-RMS</sub> | WCDMA   | WCDMA Data transfer Band IV<br>@+23.5dBm | ≤670                    |
|                        |         | WCDMA Data transfer Band V<br>@+23.5dBm  | ≤530                    |
|                        |         | LTE FDD Data transfer Band 2<br>@+23dBm  | ≤680                    |
|                        |         | LTE FDD Data transfer Band 4<br>@+23dBm  | ≤750                    |
|                        |         | LTE FDD Data transfer Band 5<br>@+23dBm  | ≤640                    |
|                        | LTE FDD | LTE FDD Data transfer Band 12<br>@+23dBm | ≤640                    |
| I <sub>LTE-RMS</sub>   | LIEFDD  | LTE FDD Data transfer Band 13<br>@+23dBm | ≤680                    |
|                        |         | LTE FDD Data transfer Band 17<br>@+23dBm | ≤680                    |
|                        | 1       | LTE FDD Data transfer Band 66<br>@+23dBm | ≤750                    |
|                        |         | LTE FDD Data transfer Band 71<br>@+23dBm | ≤680                    |

Table 3-5 Power Consumption

# 3.3 Control Signal

The NL668-AM module provides two control signals for power on/off and reset operations. The pin definitions are as follows.

| Pin name | I/O | Pin | Description  |
|----------|-----|-----|--|
| RESET_N  | I   | 20  | When the module is in work, give it a Tst (750ms~2s) low level, and then |
| RESEI_N  |     |     | pull it high, the module is reset  |
| PWRKEY   | ı   | 21  | When module is in power off mode , give it a Tst (100ms~2s) low level,   |
|          |     |     | and then pull it high, the module will power on; When module is in power |

Reproduction forbidden without Fibocom Wireless Inc. written authorization - All Rights Reserved.

| Pin name | I/O | Pin | Description   |
|----------|-----|-----|---|
|          |     |     | on mode, give it a Tst (2s~8s) low level, and then pull it high, the module |
|          |     |     | will power off  |

Table 3-6 Control Signal

#### 3.3.1 Module power on

#### 3.3.1.1 power on circuit reference

When the NL668-AM module is in power off mode, the module will power on by pulling down PWRKEY for 100ms~ 2s . It is recommended to use OC/OD drive circuit to control PWRKEY pin. The reference circuit is shown in Figure 3-4:

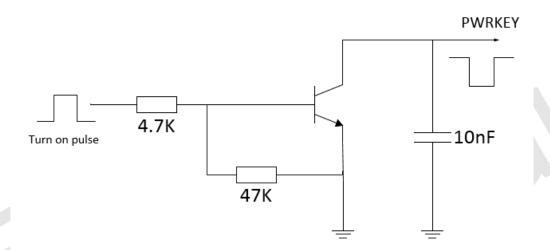

Figure 3-4 OC/OD Drive Power on Reference Circuit

Another method to control PWRKEY pin is to directly control through a button, and place a TVS

( recommended : ESD9X5VL-2/TR) near the button for ESD protection.

The reference circuit is shown in Figure 3-5.

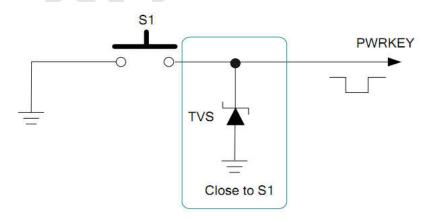

Figure 3-5 Button Power on Reference Circuit

#### 3.3.1.2 Power on Timing

The power on timing is shown in Figure 3-6:

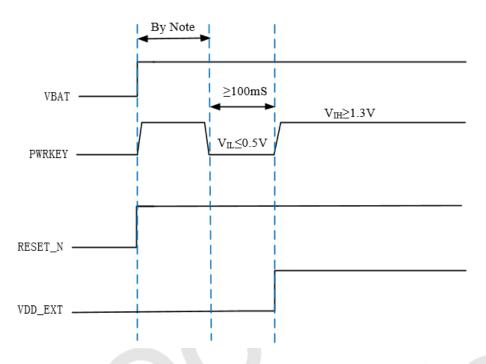

Figure 3-6 Power on Timing Control Diagram

#### Note:

Before pulling down the PWRKEY pin, make sure the VBAT voltage is stable. It is recommended that the interval between power up VBAT and pull down PWRKEY pin should not be less than 30ms.

#### 3.3.2 Module power off

The module supports the following three power off modes:

| Power off mode     | Power off methods   | Applicable scenarios   |
|--------------------|---|--|
| Low-voltage power  | When VBAT voltage is low or power down, the module will power off | The module does not power off through normal process, i.e. does not logout process from the base station |
| Hardware power off | Pull down PWRKEY (2s~ 8s)   | Normal power off   |
| AT power off       | AT+ CPWROFF   | Software power off   |

Table 3-7 Power Off Modes

#### 3.3.2.1 Power off Timing

1. When the module is working properly, do not cut off the power of the module immediately to avoid

damaging the internal Flash . It is strongly recommended to power off the module by PWRKEY or AT command before cut off the power supply.

2. When using the AT command to power off, make sure that the PWRKEY is in a high level state after the power off command is executed, otherwise the module will power on again after the power off complete.

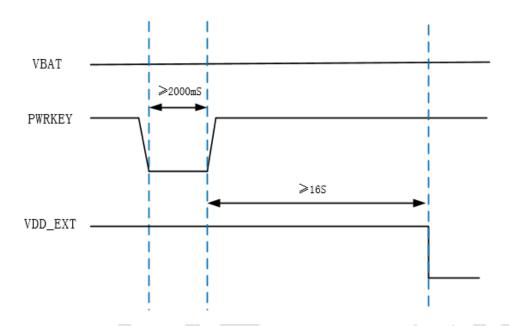

Figure 3-7 Power off Timing Control Diagram

#### 3.3.3 Module reset

NL668-AMmodule can reset by hardware and AT command.

| Reset mode | Reset method  |
|------------|---|
| Hardware   | Pull down RESET_N about 750ms~2s and then pull up the level |
| AT command | AT+RESET  |

Table 3-8 Module Reset

#### 3.3.3.1 Reset circuit

Refer to Figure 3-8 reset circuit. It is similar to the PWRKEY control circuit. The client can control the RESET\_N pin using an OC/OD drive circuit or push button.

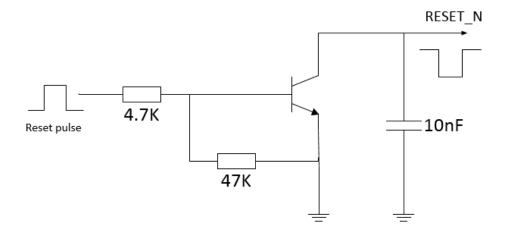

Figure 3-8 RESET\_N OC/OD Drive Reference Circuit

Another reset control is shown in Figure 3-9.

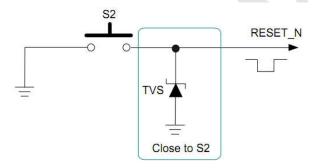

Figure 3-9 RESET\_N Button Reference Circuit

#### 3.3.3.2 RESET control Timing

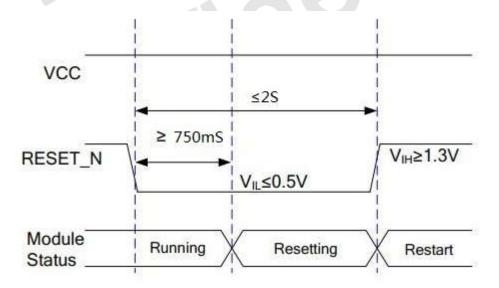

Figure 3-10 Reset Control Timing

#### Note:

RESET is a sensitive signal, so it is recommended to add an avoid debouncing capacitor close to the module. In case of PCB layout, the RESET signal lines should keep away from the RF interference and protected by Ground. Also, the RESET signal lines shall neither near the PCB edge nor route on the surface planes( avoid module reset caused by ESD problems).

#### 3.4 USB Interface

The NL668-AM module supports USB2.0 and is compatible with USB High-Speed (480Mbits/s) and USB Full-Speed (12Mbits/s). Refer to "Universal Serial Bus Specification 2.0" for the timing and electrical characteristics of the NL668-AM module USB bus.

#### 3.4.1 USB interface definition

| Pin name | I/O | Pin | Description                      |
|----------|-----|-----|----------------------------------|
| USB_DM   | I/O | 70  | USB differential data bus ( D+ ) |
| USB_DP   | I/O | 69  | USB differential data bus ( D- ) |
| USB_VBUS | PI  | 71  | USB_DET                          |

Table 3-9 USB Interface Definition

At present, USB just support USB\_VBUS detect.

For more information about the USB 2.0 specification, please refer to http://www.usb.org/home

#### Note:

Since the module supports USB 2.0 High-Speed, TVS tube equivalent capacitance on the USB\_DM/DP differential signal cable is required to be less than 1pF, and a 0.5pF capacitance TVS is recommended.

Connect a 0 ohm resistor to USB\_DM / DP differential line to help analyze problems.

USB\_DM and USB\_DP are high-speed differential signal cables, can achieve the maximum transmission rate of 480Mbits/s, and must follow the rules below in PCB Layout:

- USB DM and USB DP signal cable's control differential impedance is 90 ohm
- USB\_DM and USB\_DP signal cables shall be parallel and equal in length, and avoid the right-angle route;
- USB\_DM and USB\_DP signal cables are routed on the signal layer closest to the ground layer, and the cables shall be grounded;

#### 3.5 USIM Interface

NL668-AM module has built-in USIM card interface, and supports 1.8V and 3.0V SIM card.

#### 3.5.1 **USIM** pin

USIM pin is shown in the following table:

| Pin name      | 1/0 | Pin | Description                       |
|---------------|-----|-----|-----------------------------------|
| USIM_DATA     | I/O | 15  | USIM/SIM DATA                     |
| USIM_CLK      | 0   | 16  | Clock Signal                      |
| USIM_RESET    | 0   | 17  | RESET Signal                      |
| USIM_VDD      | 0   | 14  | USIM/SIM Power                    |
| USIM_PRESENCE | I   | 13  | Detect USIM/SIM card for Hot-swap |

Table 3-10 SIM Card Pin

#### 3.5.2 USIM interface circuit

#### 3.5.2.1 SIM card slot with detection signal

USIM/SIM design requires the use of SIM card slot (Fibocom recommend: SIM016-8P-220P). We recommend using hot plug slot with SIM\_DECTECT function.

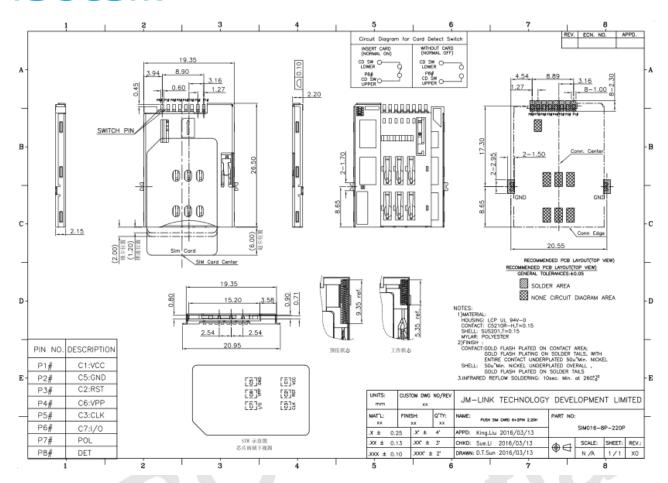

Figure 3-11 SIM Card Slot Diagram SIM016-8P-220P

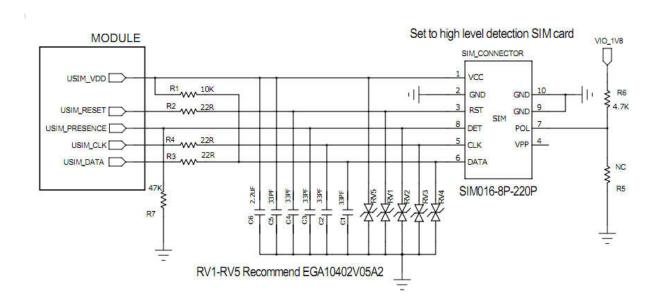

Figure 3-12 USIM/SIM Interface with Detection Signal Reference Design

Principles of SIM card slot with detection signal are as follows:

SIM card is insert, USIM\_PRESENCE pin is high level

SIM card is no insert, USIM PRESENCE pin is low level

#### 3.5.2.2 SIM card slot without detection signal

SIM card slot without detection signal, and USIM\_ PRESENCE pin remains floating.

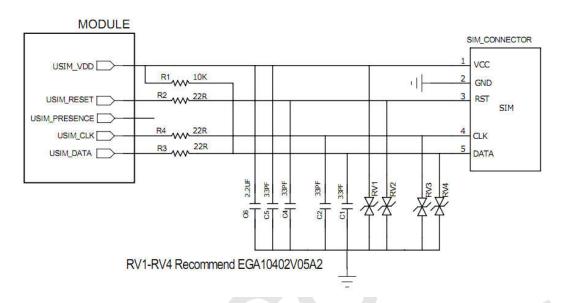

Figure 3-13 USIM/SIM Interface without Detection Signal Reference Design Diagram

#### 3.5.3 USIM hot plug

NL668-AM SIM card supports hot plug function. It determines the insertion and removal of SIM card on the slot by detecting the USIM\_ PRESENCE pin state to support hot plug function.

The SIM card hot plug function can be configured by the "AT+MSMPD" command, and the AT commands are shown in the following table:

| AT command | SIM card hot plug | Function description                                  |
|------------|-------------------|---|
|            |                   | Default, SIM card hot plug detection is enabled       |
| AT+MSMPD=1 | Enabled           | The module detects whether the SIM card is inserted   |
|            |                   | through the USIM_PRESENCE pin state                   |
|            |                   | SIM card hot plug detection function is disabled      |
| AT+MSMPD=0 | Disabled          | The module reads the SIM card when the device starts, |
|            |                   | and does not detect the USIM_PRESENCE state           |

Table 3-11SIM Card Hot Plug Function Configured AT Commands

After enabled the hot plug detection function of the SIM card, when USIM\_PRESENCE is in high level, the module will detect the SIM card insertion and then execute the initialization program of the SIM card. After reading the SIM card information, the module will register network. When the USIM\_PRESENCE is in low level, the module detects that the SIM card is removed, then it will not read the SIM card.

The USIM\_PRESENCE is in active high by default, and can be switched to active low by AT command.

| AT command            | Function description       |
|-----------------------|----------------------------|
| AT+GTSET="SIMPHASE",1 | Default ,high level detect |
| AT+GTSET="SIMPHASE",0 | Low level detect           |

Table 3-12 USIM\_PRESENCE Effective Level Switched AT command

#### 3.5.4 USIM design requirements

SIM card circuit design shall meet EMC standards and ESD requirements, and at the same time, shall improve anti-interference ability to ensure that the SIM card can work stably. The design needs to strictly observe the following rules:

- SIM card slot is placed as close to the module as possible, away from the RF antenna, DCDC power, clock signal lines and other strong interference sources;
- Adopt the SIM card slot with metal shield shell to improve anti-interference ability;
- The length of cable from the module to the SIM card slot shall not exceed 100mm. Longer cable reduces signal quality.
- USIM\_CLK and USIM\_DATA signals are ground isolated to avoid mutual interference. If it is difficult
  to do so, SIM signal needs to be ground protected as a set;
- The filter capacitor and ESD device of SIM card signal cable are placed close to the SIM card slot.
   Select 22 ~ 33pF capacitor for ESD device equivalent capacitor.

#### 3.6 UART Interface

#### 3.6.1 UART interface definition

NL668-AM module has two serial interfaces: the main serial interface and debug serial ports. The following describes the main features of these two serial ports:

The main serial ports supports 4800bps, 9600bps, 19200bps, 38400bps, 57600bps, 115200bps,

230400bps, baud rate. The default baud rate is 115200bps, used for data transmission and AT command transmission.

Debug serial port supports 115200bps baud rate for FIBOCOM debug.

The following table describes the main serial port pin.

| Pin name | I/O | Pin | Description            |
|----------|-----|-----|------------------------|
| RI       | 0   | 62  | Ring indicator         |
| DCD      | 0   | 63  | Data carrier detection |
| CTS      | I   | 64  | Clear to send          |

| Pin name | I/O | Pin | Description          |
|----------|-----|-----|----------------------|
| RTS      | 0   | 65  | Request to send      |
| DTR      | I   | 66  | Sleep mode control   |
| TXD      | 0   | 67  | Module Transmit data |
| RXD      | I   | 68  | Module Receive data  |

Table 3-13 Main Serial Port Pin

The following table describes the debug serial interface pin.

| Pin name | I/O | Pin | Description          |
|----------|-----|-----|----------------------|
| DBG_RXD  | ı   | 11  | Module Receive data  |
| DBG_TXD  | 0   | 12  | Module Transmit data |

Table 3-14 Debug Serial Port Pin

#### 3.6.2 UART port application

The serial port level of NL668-AM LCC module is 1.8V. If the level of the client host system is 3.3V or other, a level translate shall be added to the serial port connection between the module and the host. The following figure shows the reference circuit design using level translate chip:

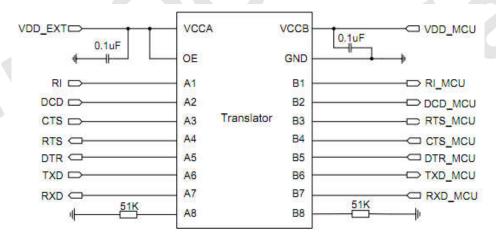

Figure 3-14 UART Level Translate Reference Circuit 1

Another level translate circuit is shown below. The input and output circuit design in the following dashed part can refer to that in the solid line part, but pay attention to the connection direction.

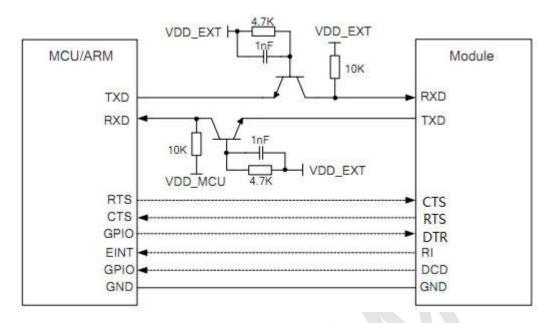

Figure 3-15 UART Level Translate Reference Circuit 2

#### Note:

This level translate circuit is not suitable for applications with baud rates above 460Kbps.

#### 3.7 Status Indicator

NL668-AM provides three network indication pins (Pin 5 is network status indicator by default, AT commands AT+LEDCFG can switch to pin 6 or pin 61).

| PIN Name   | I/O | PIN Num. | Description              |
|------------|-----|----------|--------------------------|
| NET_MODE   | 0   | 5        | Network status indicator |
| NET_STATUS | 0   | 6        | Reserved                 |
| STATUS     | 0   | 61       | Reserved                 |

Table 3-15 Network Indication pins

# 3.7.1 NET\_MODE Signal

NL668-AM module network indicator status description.

|      | ·                                  |                             |  |
|------|------------------------------------|-----------------------------|--|
| Mode | NET_MODE                           | Description                 |  |
| 1    |                                    | No SIM card                 |  |
|      | Flash (600ms High/600ms Low)       | Request SIM PIN             |  |
|      |                                    | Registering network (T<15S) |  |
|      |                                    | Register network failed     |  |
| 2    | Slow flash (75ms Low /3000ms High) | Standby                     |  |

| Mode | NET_MODE                          | Description           |  |
|------|-----------------------------------|-----------------------|--|
| 3    | Speed flash (75ms Low /75ms High) | Data link established |  |
| 4    | Low                               | Voice call            |  |

Table 3-16 Network Indicator Status Description

NL668-AM NET\_MODE interface reference circuit is as shown below.

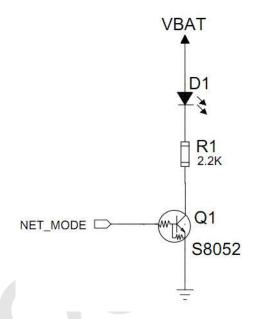

Figure 3-16 NET\_MODE Reference Design Diagram

## 3.8 Low Power Mode

## 3.8.1 Flight mode

W\_DISABLE# Pin Description:

| Pin name   | I/O | Pin | Description                |
|------------|-----|-----|----------------------------|
| W_DISABLE# |     | 4   | Module flight mode control |

Table 3-17 W\_DISABLE# Pin Description

NL668-AM supports two ways to enter the flight mode:

|   |                               | •   |
|---|-------------------------------|---|
|   |                               | First to transmit the "AT+WDISABLEEN=1"to enable the            |
| 1 | Hardware I/O interface button | W_DISABLE# function.  |
| 1 | control                       | Pull high or float (pull high by default)the W_DISABLE# signal  |
|   |                               | to enter the normal mode, pull low it to enter the flight mode. |
|   |                               | AT+CFUN=0,0enter the flight mode                                |
| 2 | AT command control            | AT+CFUN=1,0enter the normal mode                                |

Table 3-18 Module enter Fly Mode

#### 3.8.2 Sleep Mode

#### 3.8.2.1 USB Application (nonsupport USB Suspend, support VBUS)

If the host does not support the USB Suspend function, the module can enter sleep mode by disconnecting USB\_VBUS from the external control circuit:

Sleep:

Sent AT+GTLPMMODE=1,X command to set the WAKEUP\_IN control enter the sleep mode. Reset the module become effective. ( X=0, high level active to sleep; X=1, low level active to sleep)

AT+CSCLK = 1 command to enable sleep function.

AT+GTUSBSLEEPEN=1,0 command to set USB sleep mode

To draw out the USB line or disable the USB HUB controller to enter the sleep.

Wake up:

Wake up the module by plugging in the USB cable or enable the USB HUB controller.

#### 3.8.2.2 USB application (nonsupport USB Suspend, nonsupport VBUS)

If the host does not supports USB Suspend and does not support VBUS function, the module can enter sleep mode by disconnecting USB\_VBUS from the external control circuit:

Sleep:

Sent AT+GTLPMMODE=1,X command to set the WAKEUP\_IN control enter the sleep mode. Reset the module become effective. ( X=0,high level active to sleep; X=1, low level active to sleep)

AT+CSCLK = 1 command to enable sleep function.

Use AT+GTUSBDETECTEN=1 command to enable the USB software detection

AT+GTUSBSLEEPEN=1,0 command to set USB sleep mode

To draw out the USB line or disable the USB HUB controller to enter the sleep.

Wake up:

Wake up the module by plugging in the USB cable or enable the USB HUB controller.

#### 3.8.2.3 USB application (Supports USB Suspend)

If the host supports USB Suspend/Resume. Setting the USB into sleep by Linux.

Sleep:

Sent AT+GTLPMMODE=1,X command to set the WAKEUP\_IN control enter the sleep mode. Reset the module become effective. ( X=0,high level active to sleep; X=1,low level active to sleep)

AT+CSCLK = 1 command to enable sleep function.

AT+GTUSBSLEEPEN=0,0 command to set USB sleep mode

In Linux environment, set the USB level and control to AUTO. Standing the module and host about 2 seconds, that will be in suspend mode.

Wake up:

Any operation on USB will wake up the module from sleep.

#### 3.8.2.4 UART application (WAKEUP\_IN level control)

When host and NL668 module has connected through UART, use the following steps to make the module enter sleep mode:

Sent AT+GTLPMMODE=1,X command to set the WAKEUP\_IN control enter the sleep mode. Reset the module become effective. ( X=0,high level active to sleep; X=1, low level active to sleep)

AT+CSCLK = 1 command to enable sleep function.

AT+GTUSBSLEEPEN=2,X command to disable USB function (X is an arbitrary value)

Wake up:

Wake up the module by set a signal contrary with sleep on WAKEUP\_IN line.( X=0,low level active to be recall;X=1,high level active to be recall)

#### 3.8.2.5 UART application (DTR level control)

When host and NL668 module has connected through UART, use the following steps to make the module enter sleep mode:

Sent AT+GTLPMMODE=2,X command to set the DTR control enter the sleep mode. Reset the module become effective. (X=0, high level active to sleep; X=1, low level active to sleep)

AT+CSCLK = 1 command to enable sleep function.

AT+GTUSBSLEEPEN=2,X command to disable USB function (X is an arbitrary value)

Wake up the module by set a signal contrary with sleep on DTR line.( X=0, low level active to be recall; X=1, high level active to be recall).

#### 3.8.2.6 ATS24 Command

Set the module into sleep by ATS24 command . use the following steps:

Sleep:

Sent AT+GTLPMMODE=0

AT+GTUSBSLEEPEN=2,X command to disable USB function (X is an arbitrary value without 0)

ATS24=X command to into sleep after X seconds.(X is not zero)

Wake up:

Wake up the module by send the AT command fast.

Note:

Since the level of UART sleep power is different, power dissipation when use ATS24 command

to enter sleep mode is higher than Pin control to enter sleep mode.

The ATS24 function cannot ensure the module must be in sleep after X seconds, if the timer over and the module cant into sleep. It will try again.

If you want to use the RI signal to represent the state of the module, please refer to the AT+GTWAKE command in the AT manual.

## 3.9 Digital audio interface PCM

NL668-AM provides a PCM interface for communication with digital audio devices such as an external CODEC. Digital audio interface including PCM\_CLK, PCM\_SYNC, and PCM\_IN / PCM\_OUT.

## 3.9.1 Support model

| NUM. | Product model | Description |
|------|---------------|-------------|
| 1    | NL668-AM-00   | support     |
| 2    | NL668-AM-01   | support     |

Table 3-19 Support model

#### 3.9.2 PCM interface definition

| PIN Name | 1/0 | PIN Num. | Description            |
|----------|-----|----------|------------------------|
| PCM_IN   |     | 24       | PCM Input              |
| PCM_OUT  | 0   | 25       | PCM Output             |
| PCM_SYNC | I/O | 26       | PCM Synchronous Signal |
| PCM_CLK  | I/O | 27       | PCM CLK                |

|         | Band 5  | -99                          | -100                         | 10MHz Band width |
| LTE FDD | Band 12 | -98                          | -99                          | 10MHz Band width |
| LIEFDD  | Band 13 | -97                          | -99                          | 10MHz Band width |
|         | Band 17 | -98                          | -98                          | 10MHz Band width |
|         | Band 66 | -97.8                        | -98                          | 10MHz Band width |
|         | Band 71 | -98                          | -99                          | 10MHz Band width |

Table 4-3 RF Receiving Sensitivity

#### Note:

The sensitivity in the above table is the result of test conducted with the main and diversity dual antenna. If only the main antenna is used (without the diversity antenna), the sensitivity of each band of LTE will be reduced by about 3dBm.

## 4.4 GNSS Receiver

## 4.4.1 Basic description

The NL668-AM module supports the GPS/GLONASS/BeiDou functions using Qualcomm Gen8 technology.

| Description |      | Condition     | Тур. |
|-------------|------|---------------|------|
|             |      | GNSS fixing   | 68mA |
| Current cor | •    | GNSS tracking | 68mA |
| (AT+CFU     | N=U) | Standby       | 33mA |
| TTFF GNSS   |      | Cold start    | 40s  |
|             | GNSS | Warm start    | 37s  |

| Description         |           | Condition            | Тур.      |
|---------------------|-----------|----------------------|-----------|
|                     | Hot Start |                      | 4s        |
|                     | fixing    |                      | -147dbm   |
| Sensitivity         | tracking  |                      | -158dbm   |
|                     | CN0       | GNSS Signal@-130dBm  | 38.5dB-HZ |
| Positional Accuracy | CEP       | GNSS Signal @-130dBm | <4m       |

Table 4-4 GNSS Receiver

#### Note:

The current in above table test with USB plug in.

## 4.5 RF PCB Design

#### 4.5.1 Antenna RF connector

The NL668-AM three-way antenna adopts the pad-out way. It is recommended that clients use the U.FL-R-SMT-1 antenna connector and the matching RF adapter cable.

Antenna is a sensitive device, susceptible to the external environment. For example, the location of the antenna, the space it occupies, and the surrounding ground all may affect antenna performance. In addition, the RF cable connecting the antenna, and the location of the fixed antenna also may affect the performance of the antenna.

Figure 4-1 is the reference circuit design for the main and diversity antenna. These matches need to be placed close to the antenna:

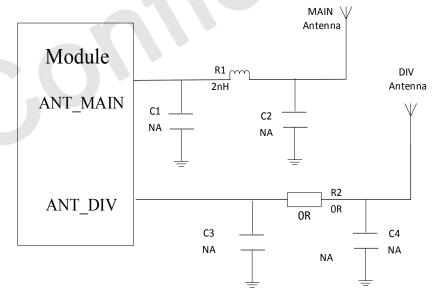

Figure 4-1RF Reference Circuit Design

Figure 4-2 shows the reference circuit design for the GNSS antenna. These matches need to be placed close to the antenna:

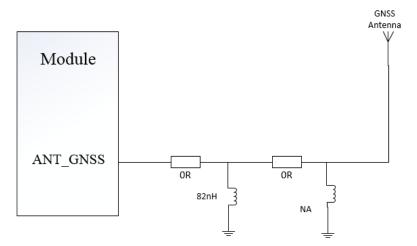

Figure 4-2 GNSS RF Reference Circuit

- Make sure the characteristic impedance of the transmission cable is 50 ohms.
- Since the antenna cable loss is less than 0.3dB, keep the PCB cable as short as possible.
- Keep the PCB LAYOUT as straight as possible, and reduce holes on the route to another layer; also avoid right-angle and acute-angle wiring.
- PCB cable should have a good reference ground to avoid other signal cable near the antenna.
- Recommend a complete ground level, and use this complete ground level as a reference ground.

The ground around the antenna must be connected to the main ground through the holes placed near the edge of the ground and tracking the cable route.

#### Note:

Refer to the document 《FIBOCOM\_RF Antenna Application Design Instruction》 for specific design

## 4.6 Antenna Design

#### 1) Antenna efficiency

Antenna efficiency is the ratio of antenna input power to emissivity. Due to the antenna return loss, material loss, and coupling loss, the radiated power is always lower than the input power. Recommend> 40% (-4dB).

#### 2) S11 or VSWR

S11 shows that the matching degree of the antenna's 50 ohm impedance, to a certain extent, affects the antenna efficiency. VSWR test methods can be used to measure this parameter. Recommend S11 <-10dB.

#### 3) Polarization

Polarization is the rotation direction of the electric field in the maximum radiation direction of the antenna. It is recommended to use linear polarization.

#### 4) Radiation pattern

Radiation pattern refers to the antenna's electromagnetic field strength in the far field in all directions. Half-wave dipole antenna is the most suitable terminal antenna. For built-in antenna, PIFA antennas or IFA antennas are recommended:

Antenna area: 6mm high\*10mm wide\*100mm long.

Antenna radiation direction: Omni\_directional.

#### 5) Gain and directivity

Antenna directivity refers to the electromagnetic field strength of electromagnetic wave in all directions. Gain is a collection of antenna benefits and antenna directivity.

Recommended antenna gain ≤2.5dBi.

#### 6) Interference

In addition to the antenna performance, other interferences on the PCB also may affect the performance of the module. In order to ensure the high performance of the module, interference must be controlled. Suggestions: For example, LCD, CPU, FPC cable, audio circuit, power supply should be as far as possible away from the antenna, and make the appropriate isolation and shielding, or filtering on the path.

#### 7) Antenna index requirements

| NL668-AM module main antenna requirements |   |  |  |
|---|---|--|--|
| Frequency range                           | It must use the most suitable antenna to adapt to the relevant frequency band |  |  |
|   | WCDMA band II(1900) : 170 MHz   |  |  |
| Bandwidth (WCDMA)                         | WCDMA band IV(1700) :170 MHz  |  |  |
|   | WCDMA band V(850) : 70 MHz  |  |  |
|   | LTE band 2(1900): 140 MHz   |  |  |
|   | LTE Band 4(1700): 445 MHz   |  |  |
|   | LTE Band 5(850): 70 MHz   |  |  |
| Bandwidth (LTE)                           | LTE Band 12(700): 47 MHz  |  |  |
| Bandwidth (LTE)                           | LTE band 17(700): 42 MHz  |  |  |
|   | LTE band 13(700): 41 MHz  |  |  |
|   | LTE Band 66(1700): 470MHz   |  |  |
|   | LTE band 71(600): 81MHz   |  |  |
| Impedance 50 ohms                         |   |  |  |

| NL668-AM module main antenna requirements |   |  |
|---|---|--|
| Input power                               | > 23dBm average power WCDMA & LTE   |  |
| Standing wave ratio recommended           | ≤ 2:1   |  |
| GNSS                                      | Frequency range: 1559MHz~1607MHz  Polarization type: right-circular or linear polarization  VSWR:: < 2(Type)  Passive antenna gain:> 0dBi |  |

Table 4-5 Main Antenna Requirement

## **5 Electrical Characteristics**

## 5.1 Limiting voltage range

The limiting voltage range refers to the power voltage of the module and the maximum voltage range that the digital and analog input/output interfaces can withstand.

The voltage range of NL668-AM is shown in the following table.

| Parameter | Description                         | Min  | Тур | Max | Unit |
|-----------|-------------------------------------|------|-----|-----|------|
| VBAT      | Power supply                        | -0.3 | -   | 4.7 | V    |
| GPIO      | Power supply voltage of digital I/O | -0.3 | -   | 2.0 | V    |

Table 5-1 Voltage Range

## 5.2 Environment temperature range

NL668-AM module is recommended to operate at -30~+75°C ambient. It is recommended that the application uses temperature control measures under harsh environmental conditions. At the same time, the limited operating temperature range of the module should be provided. Under these temperature conditions, some RF parameters may exceed the limit. It is recommended that the module application terminal be stored in certain temperature conditions. Modules outside this range may not operate or may be damaged.

| Temperature                   | Min | Тур | Max | Unit       |
|-------------------------------|-----|-----|-----|------------|
| Operating temperature         | -30 | 25  | 75  | $^{\circ}$ |
| Limited operating temperature | -40 |     | 85  | $^{\circ}$ |
| Storage temperature           | -40 |     | 85  | $^{\circ}$ |

Table 5-4 Environmental Reliability Requirements

## 5.5 ESD characteristics

NL668-AM is a consumer product. Although the design of the module has considered the ESD issue and provided ESD protection, the ESD issue may occur in the transport and secondary development, so developers should consider ESD protection for the final product. In addition to considering anti-static treatment for packaging, please refer to recommended circuit for interface design in the document for client's application.

Refer to the following table for the ESD allowable discharge range of the NL668-AM module.

| Part              | Air discharge | Contact discharge |
|-------------------|---------------|-------------------|
| VBAT,GND          | ±10KV         | ±5KV              |
| Antenna interface | ±8KV          | ±4KV              |
| Other interface   | ±1KV          | ±0.5KV            |

Table 5-5 ESD Allowable Discharge Range

# **6 Structure Specification**

# 6.1 Product Appearance

The product appearance for NL668-AM module is shown in Figure 6-1 and 6-2:

Figure 6-1Module Product Appearance (Top)
