TEST REPORT

Applicant Address	:	Sharp Corporation, Communication Systems Division 2-13-1, Iida Hachihonmatsu, Higashi-Hiroshima City, Hiroshima, 739-0192, JAPAN
Products	:	Cellular Phone
Model No.	:	SH-07F
Serial No.	:	004401115055234
FCC ID	:	APYHRO00209
Test Standard	:	CFR 47 FCC Rules and Regulations Part 22
Test Results	:	Passed
Date of Test	:	April 2 ~ 10, 2014

Kousei Shibata Manager Japan Quality Assurance Organization KITA-KANSAI Testing Center SAITO EMC Branch 7-3-10, Saito-asagi, Ibaraki-shi, Osaka 567-0085, Japan

- The measurement values stated in Test Report was made with traceable to National Institute of Advanced Industrial Science and Technology (AIST) of Japan and National Institute of Information and Communications Technology (NICT) of Japan.
- The applicable standard, testing condition and testing method which were used for the tests are based on the request of the applicant.
- The test results presented in this report relate only to the offered test sample.
- The contents of this test report cannot be used for the purposes, such as advertisement for consumers.
- This test report shall not be reproduced except in full without the written approval of JQA.
- VLAC does not approve, certify or warrant the product by this test report.

DEFINITIONS FOR ABBREVIATION AND SYMBOLS USED IN THIS TEST REPORT

EUT	: Equipment Under Test	EMC	: Electromagnetic Compatibility
AE	: Associated Equipment	EMI	: Electromagnetic Interference
N/A	: Not Applicable	EMS	: Electromagnetic Susceptibility

- N/T : Not Tested
- \boxtimes indicates that the listed condition, standard or equipment is applicable for this report.
- □ indicates that the listed condition, standard or equipment is not applicable for this report.

1 Description of the Equipment Under Test

1. Manufacturer : Sharp Corporation, Communication Systems Division 2-13-1, Iida Hachihonmatsu, Higashi-Hiroshima City, Hiroshima, 739-0192, JAPAN 2. Products : Cellular Phone Model No. : SH-07F 3. Serial No. • 4. 004401115055234 : Product Type : Pre-production 5.Date of Manufacture : March, 2014 6. 7. Power Rating : 4.0VDC (Lithium-ion Battery SH39 820mAh) : 8. EUT Grounding None 9. **Transmitting Frequency** : 824.2 MHz(128CH) - 848.8 MHz(251CH) 869.2 MHz(128CH) - 893.8 MHz(251CH) 10. Receiving Frequency : 11. Emission Designations 250KGXW : : 1.820W (ERP) 12. Max. RF Output Power 13. Category • **GSM850** 14. EUT Authorization : Certification 15. Received Date of EUT : March 27, 2014

16. Channel Plan

The carrier spacing is 200 kHz.

The carrier frequency is designated by the absolute frequency channel number (ARFCN). The carrier frequency is expressed in the equation shown as follows:

Transmitting Frequency (in MHz) = $824.2 + 0.2 \times (n - 128)$ where, n : channel number ($128 \le n \le 251$)

Receiving Frequency (in MHz) = $869.2 + 0.2 \times (n - 128)$ where, n : channel number ($128 \le n \le 251$) Page 3 of 42

Page 4 of 42

2 Summary of Test Results

Applied Standard : CFR 47 FCC Rules and Regulations Part 22 Subpart H – Cellular Radiotelephone Service

The EUT described in clause 1 was tested according to the applied standard shown above. Details of the test configuration is shown in clause 6.

The conclusion for the test items of which are required by the applied standard is indicated under the test result.

 \boxtimes - The test result was **passed** for the test requirements of the applied standard.

 \Box - The test result was **failed** for the test requirements of the applied standard.

□ - The test result was **not judged** the test requirements of the applied standard.

In the approval of test results,

- Determining compliance with the limits in this report was based on the results of the compliance measurement, not taking into account measurement instrumentation uncertainty.
- No deviations were employed from the applied standard.
- No modifications were conducted by JQA to achieve compliance to the limitations.

3 Test Procedure

Test Requirements	:	CFR 47 FCC Rules and Regulations Part 2 §2.1046, §2.1047, §2.1049, §2.1051, §2.1053, §2.1055 and §2.1057
Test Procedure	:	ANSI C63.4–2003, TIA/EIA–603-C-2004 FCC KDB 971168 D01 Licensed DTS Guidance v02r01, released June 7, 2013

4 Test Location

Japan Quality Assurance Organization (JQA) KITA-KANSAI Testing Center 7-7, Ishimaru, 1-chome, Minoh-shi, Osaka, 562-0027, Japan SAITO EMC Branch 7-3-10, Saito-asagi, Ibaraki-shi, Osaka 567-0085, Japan

5 Recognition of Test Laboratory

JQA KITA-KANSAI Testing Center SAITO EMC Branch is accredited under ISO/IEC 17025 by following accreditation bodies and the test facility is registered by the following bodies.

VLAC Accreditation No.	:	VLAC-001-2 (Expiry date : March 30, 2016)
VCCI Registration No.	:	A-0002 (Expiry date : March 30, 2016)
BSMI Registration No.	:	SL2-IS-E-6006, SL2-IN-E-6006, SL2-R1/R2-E-6006, SL2-A1-E-6006
		(Expiry date : September 14, 2016)
IC Registration No.	:	2079E-3, 2079E-4 (Expiry date : July 20, 2014)

Accredited as conformity assessment body for Japan electrical appliances and material law by METI. (Expiry date : February 22, 2016)

6 Details of the Equipment Under Test

6.1 Operating Condition

The test were carried under one modulation type shown as follows: Modulation Burst Signal : DATA TSC 5 in accordance with GSM 05.02.

The Radiated Emission test were carried under 2 test configurations shown in clause 6.3. In all tests, the fully charged battery is used for the EUT.

Other Clock Frequency 32.768 kHz, 13.56 MHz, 27.456 MHz, 40.95 MHz, 48 MHz, 52 MHz

The EUT was rotated through three orthogonal axis (X, Y and Z axis) in radiated measurement. The EUT with temporary antenna port was used in conducted measurement.

Page 12 of 42

7.2.3 Test Method and Test Setup (Diagrammatic illustration)

Step 1:

In order to obtain the maximum emission, the EUT was placed at the height 1.5 m on the non-conducted support and was varying at three orthogonal axes, at the distance 3 m from the receiving antenna and rotated around 360 degrees.

The receiving antenna height was varied from 1 m to 4 m.

The EUT on the table was placed to be maximum emission against at the receiving antenna polarized (vertical and horizontal).

Then the meter reading of the spectrum analyzer at the maximum emission was A dB(μ V).

Step 2:

The EUT was replaced to substitution antenna at the same polarized under the same condition as step 1.

The RF power was fed to the transmitting antenna through the RF amplifier from the signal generator.

In order to obtain the maximum emission level, the height of the receiving antenna was varied from 1 m to 4 m.

The level of maximum emission was A dB(μ V), same as the recorded level in the step 1.

Then the RF power into the substitution horn antenna was P (dBm).

The ERP/EIRP output power was calculated in the following equation.

 $\begin{array}{l} {\rm ERP}\;({\rm dBm})={\rm P}\;({\rm dBm})-{\rm Balun\;loss\;of\;the\;tuned\;dipole\;antenna\;({\rm dB})+{\rm Cable\;loss\;({\rm dB})}\\ {\rm EIRP}\;({\rm dBm})={\rm P}\;({\rm dBm})+{\rm Gh\;({\rm dBi})} \end{array} \end{array}$

where, Gh(dBi): Gain of the substitution horn antenna.

Calculated result at 1697.6 MHz.	as the worst	point shown on
Corr. Factor	=	12.8 dB
+) Meter Reading	=	-53.3 dBm
Result	=	-40.5 dBm
Minimum Margin: -13.0 - (-40.5) =	=27.5 (dB)	

NOTES

1. The spectrum was checked from 9 kHz to 10 GHz.

2. Applied limits : -13.0 [dBm] = $10\log(TP[mW]) - (43 + 10\log(tp[W])) = 10\log(TP[mW]) - (43 + (10\log(TP[mW]) - 30))$ where, tp[W] = TP[mW] / 1000 : Transmitter power at anttena terminal

3. The correction factor is shown as follows:

Corr. Factor [dB] = Cable Loss + 10dB Pad Att. [dB] (9 kHz - 2 GHz)

Corr. Factor [dB] = Cable Loss + 10dB Pad Att. + High Pass Filter Loss (D-96) [dB] (over 2 GHz)

4. The symbol of "<" means "or less".

5. The symbol of ">" means "more than".

7.7.3 Test Method and Test Setup (Diagrammatic illustration)

Step 1) The spurious radiation for transmitter were measured at the distance 3 m away from the EUT which was placed on a non-conducted support 0.8 m in height and was varying at three orthogonal axes. The receiving antenna was oriented for vertical polarization and varied from 1 m to 4 m until the maximum emission level was detected on the measuring instrument. The EUT was rotated 360 degrees until the maximum emission was received. The measurement was also repeated with the receiving antenna in the horizontal polarization.

This test was carried out using the half-wave dipole antenna for up to 1GHz and using the horn antenna for above 1 GHz.

Step 2)

A) Up to 1 GHz

The ERP measurement was carried out with according to Step 2 in Clause 7.2.4. Then the RF power in the substitution antenna half-wave dipole antenna for up to 1 GHz and the substitution horn antenna for above 1 GHz.

The ERP is calculated in the following equation.

ERP(dBm) = P(dBm) - (Balun Loss of the half-wave dipole Ant. (dB)) + Cable Loss(dB)

B) Above 1 GHz

The ERP is calculated from the maximum emission level by the following formula.

$$\frac{e^2}{120\pi} = \frac{eirp}{4\pi d^2} \quad \dots (Eq.1)$$

 $erp = eirp - Gd \cdots (Eq.2)$

Where, e[V/m]: Field Strength at measuring distance(d=3m)

eirp[W]: Equivalent Isotropic Radiated Power

erp[*W*] : Effective Radiated Power

Gd(dBi): Gain of the substitution half-wave dipole antenna(2.15dBi)

$$eirp = \frac{(de)^2}{30} = \frac{3}{10}e^2$$

$$\therefore 10 \log(eirp) = 20 \log(e) + 10 \log(3/10) = 20 \log(e) - 5.23$$

$$10 \log(eirp) = EIRP[dBm] - 30$$

$$20 \log(e) = E[dB(\mu V / m)] - 120$$

$$EIRP = E - 120 + 30 - 5.23 = E - 95.23$$

$$ERP[dBm] = EIRP - 2.15 = E - 97.38$$

The respective calculated ERP of the spurious and harmonics were compared with the ERP of fundamental frequency by specified attenuation limits, $43+10\log_{10}$ (TP in watt)[dB]. Where, TP = Transmitter power at the ANT OUT under test configuration as the hands free unit used.

7.8.3 Test Method and Test Setup (Diagrammatic illustration)

Frequency Stability versus Temperature

The EUT was placed in an environmental chamber and was tested in the range from -30 to +50 degrees Celsius. The EUT was stabilized at each temperature. The power (4.0VDC) supplied was applied to the transmitter and allowed to stabilize for 10 minutes. The transmitting frequency was measured at startup and 2 minutes, 5 minutes and 10 minutes after startup. This procedure was repeated from -30 to +50 degrees Celsius at the interval of 10 degrees.

Frequency Stability versus Power Supply Voltage

The EUT was placed in an environmental chamber and was tested at the temperature of +20 degrees Celsius. The EUT was stabilized at the temperature. The power (4.0VDC) and the power (3.7VDC, the ending voltage) was applied to the EUT allowed to stabilize for 10 minutes. The transmitting frequency was measured at startup and 2 minutes, 5 minutes and 10 minutes after startup.

-30	- 0.16	- 0.12	- 0.11	+ 0.10	2.50	2.34
-20	- 0.13	- 0.12	- 0.10	- 0.10	2.50	2.37
-10	- 0.08	- 0.07	- 0.06	- 0.06	2.50	2.42
0	- 0.12	- 0.09	- 0.07	- 0.07	2.50	2.38
10	- 0.07	- 0.07	- 0.08	- 0.08	2.50	2.42
20	- 0.07	- 0.07	- 0.08	- 0.06	2.50	2.42
30	- 0.07	- 0.08	- 0.07	- 0.08	2.50	2.42
40	- 0.07	- 0.08	- 0.07	- 0.06	2.50	2.42
50	- 0.07	- 0.08	- 0.08	- 0.08	2.50	2.42

2. Frequency Stability Measurement versus Power Supply Voltage

Transmitting Freq Ambient Temperatu	uency re:	: 836.400 MHz (18 : 20 °C	89 ch)				
DC Supply		Deviat	Deviation [ppm]			Margin	
Voltage [V]	Startup	2 minutes	5 minutes	10 minutes	[ppm]	[ppm]	
4.0	- 0.07	- 0.07	- 0.08	- 0.06	2.50	2.42	
3.7(Ending)	- 0.09	- 0.08	- 0.07	- 0.07	2.50	2.41	

 Test condition example as the maximum deviation point shown on underline:

 Ambient Temperature
 : -30 °C
 / Startup

 DC Supply Voltage
 : 4 VDC

 Minimum Margin:
 2.50 - 0.16 = 2.34 (ppm)

 NOTE : The measurement were made after all of components of the oscillator sufficiently stabilized at each temperature.
