Information in this document is provided solely to enable system and software implementers to use Freescale Semiconductor products. There are no express or implied copyright licenses granted hereunder to design or fabricate any integrated circuits or integrated circuits based on the information in this document.

Freescale Semiconductor reserves the right to make changes without further notice to any products herein. Freescale Semiconductor makes no warranty, representation or guarantee regarding the suitability of its products for any particular purpose, nor does Freescale Semiconductor assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation consequential or incidental damages. "Typical" parameters that may be provided in Freescale Semiconductor data sheets and/or specifications can and do vary in different applications and actual performance may vary over time. All operating parameters, including "Typicals", must be validated for each customer application by customer's technical experts. Freescale Semiconductor does not convey any license under its patent rights nor the rights of others. Freescale Semiconductor products are not designed, intended, or authorized for use as components in systems intended for surgical implant into the body, or other applications intended to support or sustain life, or for any other application in which the failure of the Freescale Semiconductor product could create a situation where personal injury or death may occur. Should Buyer purchase or use Freescale Semiconductor products for any such unintended or unauthorized application, Buyer shall indemnify and hold Freescale Semiconductor and its officers, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that Freescale Semiconductor was negligent regarding the design or manufacture of the part.

A.1	PCB Layout . . . . .	A-1
-----	----------------------	-----

## About This Book

This guide provides detailed information about the MC13192 Sensor Applications Reference Design (SARD). The SARD provides all the components to evaluate and use an MC13192. It is intended to allow a system engineer or software developer to gain an understanding of the MC13192 and its protocol.

## Audience

The guide is intended for software and system engineers who are developing their products or software applications making use of the MC13192 to achieve wireless connectivity capability.

It is assumed that the reader has a good working knowledge of general-purpose microcontrollers (MCU).

## Organization

The book is divided into 1 chapter and 1 appendix.

**Chapter 1** introduces the MC13192 Sensor Applications Reference Design (SARD) functionality and features.

**Appendix A** provides figures of the SARD printed circuit board.

## Conventions

This section names, describes, and defines the conventions used in the book. This document uses the following conventions:

- **OVERBAR** is used to indicate a signal that is active when pulled low: for example,  $\overline{\text{RESET}}$ .
- *Logic level one* is a voltage that corresponds to Boolean true (1) state.
- *Logic level zero* is a voltage that corresponds to Boolean false (0) state.
- To *set* a bit or bits means to establish logic level one.
- To *clear* a bit or bits means to establish logic level zero.
- A *signal* is an electronic construct whose state conveys or changes in state convey information.
- A *pin* is an external physical connection. The same pin can be used to connect a number of signals.
- *Asserted* means that a discrete signal is in active logic state.
  - *Active low* signals change from logic level one to logic level zero.
  - *Active high* signals change from logic level zero to logic level one.
- *Negated* means that an asserted discrete signal changes logic state.
  - *Active low* signals change from logic level zero to logic level one.
  - *Active high* signals change from logic level one to logic level zero.
- **LSB** means *least significant bit* or *bits*, and **MSB** means *most significant bit* or *bits*. References to low and high bytes or words are spelled out.

## Definitions, Acronyms, and Abbreviations

The following list defines the acronyms and abbreviations used in this document. As this template develops, this list will be generated from the document. As we develop more group resources, these acronyms will be easily defined from a common acronym dictionary. Please note that while the acronyms are in solid caps, terms in the definition should be initial capped ONLY IF they are trademarked names or proper nouns.

ISM	Industrial Scientific Medical
PER	packet error rate
RF	radio frequency
Rx	receive
SPI	serial peripheral interface
Tx	transmit

## References

The following sources were referenced to produce this book:

1. ESD Style Guide.
2. IEEE® Guide to Software Requirements Specifications, July 1984.
3. Embedded Bootloader Reference Manual, 802154EBRM/D.

## Revision History

The following table summarizes revisions to this manual since the previous release (Rev. 1.3).

**Revision History**

Location	Revision
September 1, 2004	This document's updated format reflects that the Semiconductor Products Sector of Motorola, Inc. became Freescale Semiconductor, Inc. in 2004
October 19, 2004	Changed references of DIG-536 EVB to 13192-SARD.
October 29, 2004	Update power supply options and schematic.

# Chapter 1

## Introduction and Configuration

This section introduces the MC13192 Sensor Applications Reference Design (SARD) basic components, features, hardware configuration, and applications and programming options.

### 1.1 Safety Information

Any modifications to this product may violate the rules of the Federal Communications Commission and make operation of the product unlawful.

47 C.F.R. Sec. 15.21

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help.

47 C.F.R. Sec.15.105(b)

This equipment complies with FCC radiation exposure limits set forth for an uncontrolled environment. The antenna(s) used for this equipment must be installed to provide a separation distance of at least 8 inches (20cm) from all persons.

This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions:

1. This device may not cause harmful interference.
2. This device must accept any interference received, including interference that may cause undesired operation.
3. This device is susceptible to electrostatic discharge (ESD) and surge phenomenon.

## 1.2 MC13192 Sensor Applications Reference Design (SARD) Components

The MC13192 Sensor Applications Reference Design (SARD) introduces users to the MC13192 2.4 GHz wireless data transceiver. It includes an RS232 port, background debug module for in-circuit hardware debug, switches, LEDs, and a host MCU and allows the user flexibility in establishing wireless data networks.

Features of the MC13192 SARD include:

- Provides all hardware required for a complete 2.4 GHz wireless node using IEEE 802.15.4 packet structure.
- One MC13192 2.4 GHz transceiver RF reference design with printed circuit antenna.
- One MC9S08GT60 low-power, low-voltage MCU with 60KB of on-chip Flash.
- Background Debug Module (BDM) programming port for support of Metrowerks CodeWarrior™ Development Studio.
- Provides IEEE 802.15.4 modem.
- Two Accelerometers: MMA6261Q (X and Y axis), MMA1260D (Z axis)
- RS-232 port for interface with a personal computer.
- Four switches and LEDs for control and monitoring.
- Reset switch for program reset.
- Scalable software support:
  - Proprietary point-to-point or star networking using Freescale's Simple Medium Access Control (SMAC) software
  - IEEE 802.15.4 Standard compliant networking using Freescale's MAC/PHY
  - ZigBee™ networking using Freescale's Z-stack software

## 1.3 Hardware Description

As previously stated, the MC13192 Sensor Applications Reference Design (SARD) provides the hardware required to establish a wireless node using a variety of protocols. [Figure 1-1](#) shows a simplified block diagram of two SARDs connected in a simple point-to-point network. Optional personal computers are shown for control and monitoring.

The SARD is a 2 inch x 3 inch module that comprises a complete network node containing the MC13192, crystal, printed circuit antenna and MCU. Also included are jumper-selectable X-Y and Z Axis Accelerometers, four switches, and four LEDs for monitoring purposes. The SARD derives its power from a 9V battery.

### NOTE

Do not use a Lithium battery.

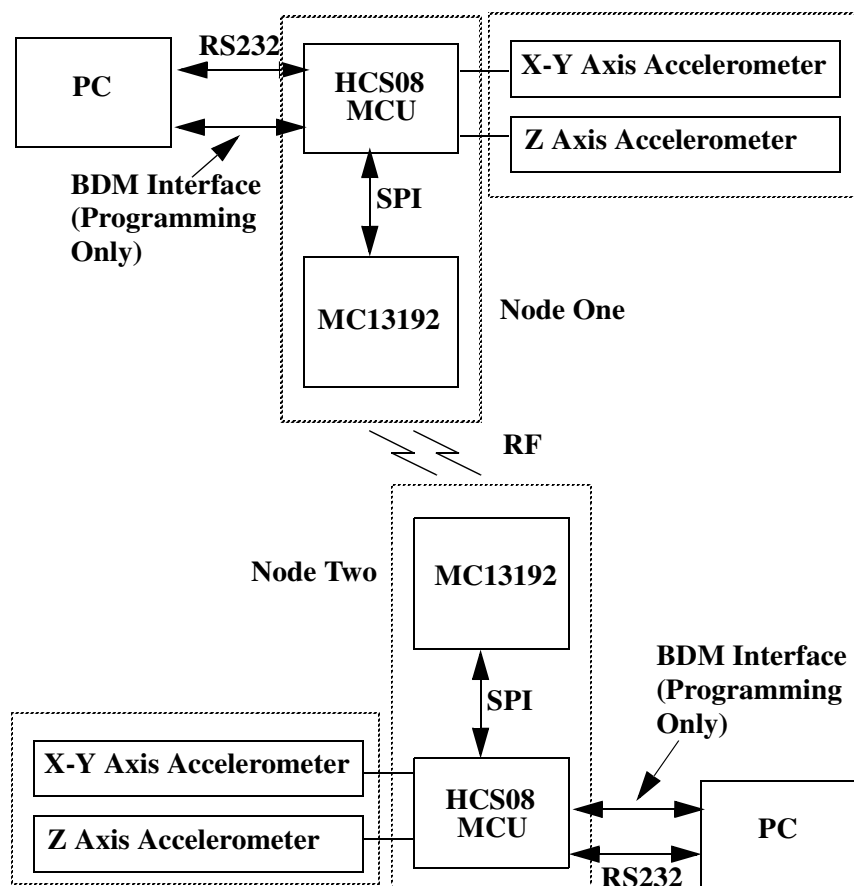

Figure 1-1. Point to Point MC13192 SARD Block Diagram

### 1.3.1 MC13192 SARD Circuit Description

Figure 1-2 shows the MC13192 SARD schematic. Appendix A includes board layout, including the printed dipole receive and transmit antennas, and Bill of Material information. All circuitry required for a 2.4 GHz wireless node is provided. The heart of the design is the MC13192 2.4 GHz transceiver and the MC9S08GT60 microcontroller. All connections for control of the transceiver by the MCU are provided. Peripherally, four LEDs and switches interfacing with the MCU are provided for control and demonstration purposes.

Three accelerometers are provided. An MMA6261Q (X and Y axis) and an MMA1260D (Z axis) for demonstration purposes. A Background Debug Module (BDM) port is provided for programming using the CodeWarrior™ Development Studio to develop and in-circuit debug code and program the MCU. An RS-232 interface is provided to allow monitoring or programming.

### Figure 1-2. MC13192 SARD Schematic

### 1.3.2 RS232 Connector J102

The RS232 port is J102, a DB9 connector. A standard straight-through DB9 serial cable can be used with a PC. The port follows the standard RS232 DCE DB9 convention as shown in [Figure 1-3](#). The RS232 is normally used to connect the SARD to a PC. With an installed bootloader program such as the Sensor Applications Reference Design (SARD) Embedded Bootloader program, described in document number 802154EBRM/D, it can also be used to program the MCU.

**Figure 1-3. DCE-DB9 Female Connector (Looking into the SARD Connector)**

### Figure 1-4. SARD Component Layout

### 1.3.3 Power Capability

The SARD can be powered from a 9 V battery connected to the board-mounted battery terminals. See [Figure 1-4](#) for battery terminal placement. If the accelerometers are not used, 2.0-3.4V can be supplied on J103. In this configuration, the accelerometer outputs are indeterminate.

## NOTE

Do not use a Lithium battery.

### 1.3.4 LEDs and Switches

D101 through D104 and Switches S101 through S104 are connected to I/O as shown on the SARD schematic and in [Figure 1-4](#). These are useful as indicators and control in applications. Connections to MCU ports are listed in [Table 1-1](#). The on-off switch, S105 is labeled on the board.

**Table 1-1. LED and Switch Port Connection**

LED/Switch	MCU Port	I/O
LED 1, D101	PTD0	Output
LED 2, D102	PTD1	Output
LED 3, D103	PTD3	Output
LED 4, D104	PTD4	Output
RESET, S106	RESET	----
S101	PTA2	Input
S102	PTA3	Input
S103	PTA4	Input
S104	PTA5	Input

### 1.3.5 Board Reset Function

A hardware reset can be performed on the SARD in two ways:

- The Reset push button.
- The MCU resets the SARD as part of its startup sequence when power is applied and the On/Off switch is turned on.

In both cases, the reset sequence resets the MCU which, in turn, resets the MC13192.

### 1.3.6 MCU General Purpose Input/Output (GPIO)

[Figure 1-4](#) shows the MCU GPIO that can be interfaced with external hardware such as sensors. When using the on-board accelerometers, shunts must be installed at PTB0, PTB1, and PTB7, which corresponds to pins 1 and 2, 3 and 4, 11 and 12, of J105, to connect the accelerometer ICs to the MCU. For user defined applications, these shunts can be removed and other hardware attached to the GPIO pins.

### 1.3.7 BDM Port

Header J101 is a BDM port for use with a P&E BDM-Multilink cable which is available from Metrowerks. The BDM cable is used with CodeWarrior™ Development Studio for the HCS08 to program the MCU flash memory as well as performing in-circuit debugging. See [Figure 1-4](#) for the position of pin 1. The red lead of the BDM cable must align to pin 1 of J101.

When using the parallel port version of the BDM cable, the BDM pod should be powered with a 2 - 5 V negative center contact power supply. A 9 V battery is not capable of sourcing the current required by the parallel BDM pod during programming and debug.

## 1.4 Applications and Programming Information

### 1.4.1 Accelerometer Application Demo

The SARD comes pre-programmed with the accelerometer demo software. See the *Accelerometer Demonstration Quick Start Guide*, document number AN2762/D for installation and startup instructions. The receiver is connected to a PC COM port via an RS232 cable. The 9 V battery needs to be installed on the battery terminals and the on/off switch turned on. Start the accelerometer GUI software, available from our website, and choose the COM port you are using in the dialog box. Install the 9 V battery on the transmitter and turn it on. On the PC screen you can select various ways to display the accelerometer data. One popular way is the cursor mode where you can watch the cursor position move as the transmitter is moved.

### 1.4.2 Programming the SARD (User Defined Software)

A BDM programmer is used to load the MCU flash memory. Alternatively, the Embedded Bootloader software, described in the, *Embedded Bootloader Reference Manual*, document number 802154EBRM/D, can be installed and the SARD can be programmed through the RS-232 port.
